

Five Building Energy Improvements to Help the Utility Plant

Jarrold McMains, CEM

Campus Energy 2016: The
Changing Landscape
February 8-12, 2016

AGENDA

- ▶ Background
- ▶ Define the Goal
- ▶ Five Building Strategies
- ▶ Discussion

BACKGROUND

▶ District Energy System Benefits (partial list)

- Aesthetics (elimination of cooling towers & stacks)
- Increased Redundancy & Reliability
- Ease of using multiple fuels & technologies
- Ease of changing systems

▶ Can naturally create a rift between Production (Provider) and Demand (User)

- Users question reliability, system efficiency, metering accuracy...
- Providers are handcuffed by how Users operate buildings
- Goals are not aligned, and the transparency to do so does not always exist

BACKGROUND

- ▶ Users and Providers individually optimize
 - Plants install more efficient equipment, integrate the system more efficiently, implement heat recovery, etc...
 - Users decrease building energy use with HVAC and process optimization
- ▶ Results in Sub-Optimization of the District Energy System
- ▶ Must start thinking about maximum combined efficiency
 - But this is **not easy**, can be **iterative**, and is constantly **evolving**,

DEFINE THE GOAL

- ▶ One size does not fit all
- ▶ Takes total participation (All DES stakeholders)

- ▶ What's to Gain?

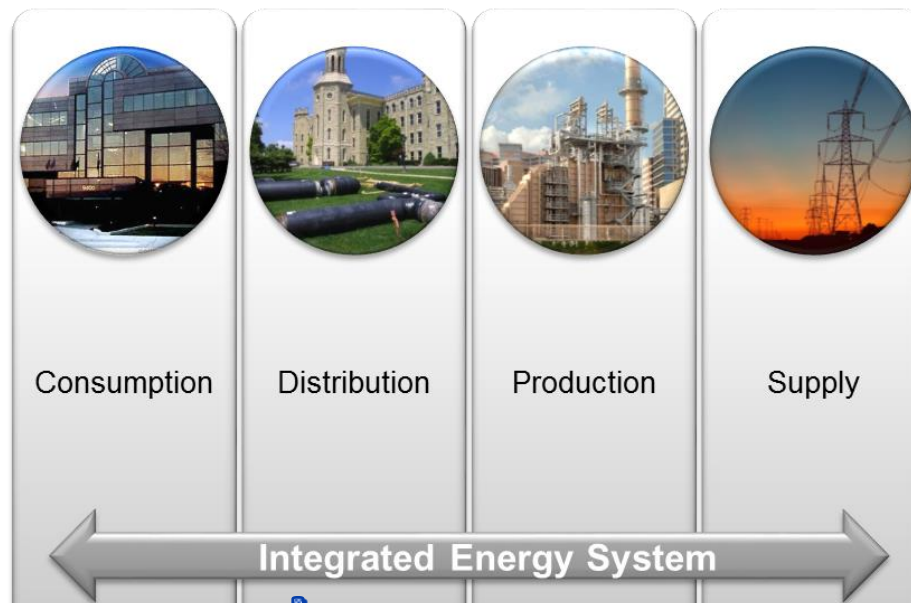

- Efficiency
- Fuel Cost Savings
- Sustainability Goals
- Capital Cost Deferral
- Emission Reductions
- Improved Building Occupancy
- Air Permitting
- Maintenance
- Publicity

DEFINE THE GOAL

- ▶ No matter the goal, energy efficiency is a focal point
- ▶ First **reduce** the load, then **optimally** serve that load

So how do we make our systems more efficient?

FIVE BUILDING STRATEGIES TO OPTIMIZE THE CAMPUS SYSTEM

1. Ghost Load Elimination
2. Hydronic Flow Control
3. Peak Driver Reduction or Offset
4. Heat Exchanger Sizing
5. Enhanced HVAC Controls

Baseline EUI
vs. Benchmark Building

GHOST LOAD ELIMINATION (#1)

► What Is It?

- Artificial Loads on the System

► Why Fix It?

- These usually add to system peak demand

► Examples

Simultaneous Heating & Cooling | Other Loads

GHOST LOAD ELIMINATION (#1)

Simultaneous Heating & Cooling

Example

Two Air Handlers
110,000 cfm total

Peak Savings

3 MMBtu/hr Heating
200 tons Cooling

Annual Energy Savings
\$250,000

GHOST LOAD ELIMINATION (#1)

Other Loads

- DHW Heating
- Ice Melt
- Duct Leakage, Missing Pipe Insulation
- Process Cooling
- Failed Economizers
- Failed Steam Traps

HYDRONIC FLOW CONTROL (#2)

► What Is It?

- Never heard of this???

► Why Fix It?

- Pumping Energy can account for as much as 30% of total DES energy !!!
- Low ΔT causes strains on distribution and overrun production assets

► Examples

Control valves | Coil Cleaning | Heat Exchanger Sizing | Controls Optimization

HYDRONIC FLOW CONTROL (#2)

► Control Valves

- Pressure Independent Control Valves

► Coil Cleaning

- Air and Fluid Side Cleaning
- Put space between coils in Air Handlers!

HYDRONIC FLOW CONTROL (#2)

► Heat Exchanger Sizing

- Marginal Upfront Cost for Long Term Savings
- Size Air Handler coils for maximum reasonable ΔT
 - Chilled Water (12-18°F) | Heating Water (40-80°F)
- Size building decoupling heat exchangers (if necessary) for low approach and high delta-T

► Poor Controls

- Use existing Building Automation System (BAS) to find set points causing poor coil performance

PEAK REDUCTION / OFFSET (#3)

► What Is It?

- Strategically reducing or shifting peak load energy uses

► Why Fix It?

- Sometimes very low cost options to manage peak load

► Examples

Thermal Storage | Optimizing Night Setback and Warmup Modes

Pipe Loads in Series | Heat Recovery

PEAK REDUCTION / OFFSET (#3)

Thermal Storage

- Domestic Hot Water Storage
- Reduce unoccupied outside air ventilation rates

PEAK REDUCTION / OFFSET (#3)

► Optimizing Night Setback and Warmup Modes

- Building efficiency measures often result in night setback modes
- Can realize energy savings (reduced fan power, building shell heat loss)
- Can significantly add to peak heating demand in the morning

PEAK REDUCTION / OFFSET (#3)

► Pipe Loads in Series

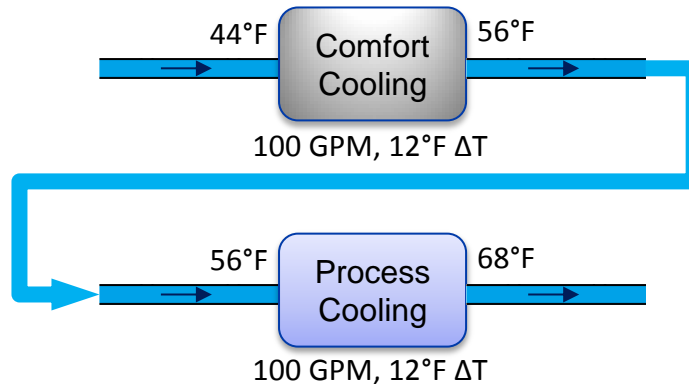

- Get double the heat for the same flow

CASE 1: PARALLEL LOADS

RESULT: 200 GPM, 100 tons
 $\Delta T = 12^\circ\text{F}$

CASE 2: SERIES LOADS

RESULT: 100 GPM, 100 tons
 $\Delta T = 24^\circ\text{F}$

PEAK REDUCTION / OFFSET (#3)

► Heat Recovery

- Examples: Run Around Coils, Enthalpy Wheels, Heat Pipes, Heat Recovery Chiller
- Retro-Commissioning Failed Systems
- Installing New Systems
- Bottom Line is to Move Heat Around the Building, then Add or Subtract

ENHANCED HVAC CONTROLS (#4)

► What Is It?

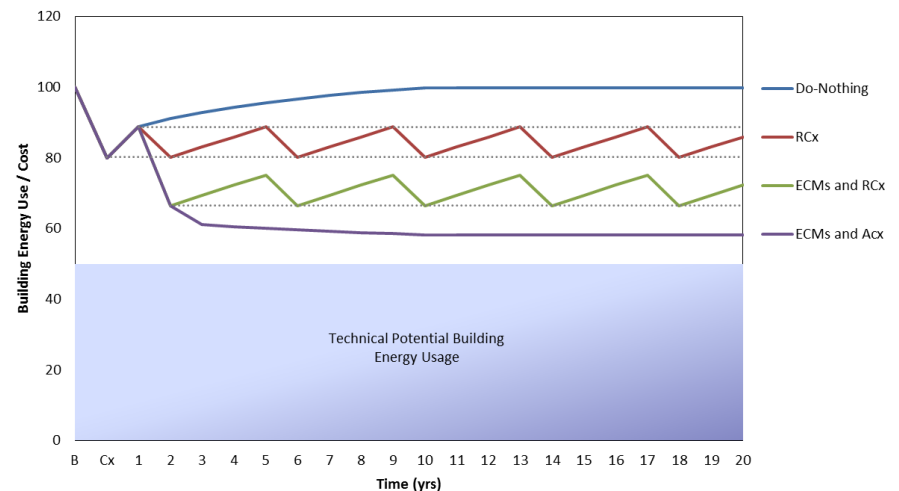

- Two Step Process: Make what you have work, then **Enhance** it...

► Why Fix It?

- Building controls are the most under-utilized asset in buildings
- The Sawtooth Effect

► Examples

- ASHRAE Sequences
- Design Standards
- Fault Detection & Diagnostics (FDD)

ENHANCED HVAC CONTROLS (#4)

▶ ASHRAE “Best of Class” Sequences

- Guideline 36 – provides program language for BAS use

▶ Design Standards

- Create and maintain building HVAC and controls design standards
- Minimal investment to maximize building efficiency
- Include standard sequences to cover 90% of installations and retrofits
 - ▶ AHU, VAVs, Unitary Equipment Chilled Water Systems, Hot Water Systems
- Include controls points lists, feedback requirements
- Develop a strategy to deal with “Big Data”

ENHANCED HVAC CONTROLS (#4)

Fault Detection & Diagnostics (FDD) Keys to Success

1. Understand the building use
2. Rectify the building systems
3. Perform a **Data Integrity** test
4. Quantify the building's **FDD Readiness**
5. Develop the **Building Baseline**
6. Use ROI to develop the case for FDD
7. Select a partner and implement the software

	JCI VAV Model: 2514A	March 14 6:03 AM	Efficiency less than 80%	BR.BR1.Floor1
Details Causes Performance Chart				
 Name: JCI VAV Model 2514A Area: BR.BR1.Floor1 Faults this week: 3				
ii	JCI VAV Model: 3102A	March 14 3:42 AM	Not operating within parameters	BR.BR1.Floor10
ii	Hurst Boiler Model: B145	March 14 3:11 AM	Heating ratio less than 20%	BR.BR1
ii	Carrier Chiller Model: C52	March 14 3:06 AM	Chilling ratio less than 20%	BR.BR1
ii	JCI VAV Model: 2514A	March 14 12:13 AM	Air flow vs fan speed ratio less than 10%	BR.BR1.Floor5

COMMUNICATION (#5)

► What Is It?

- “the imparting or exchanging of information or news”

► Why Fix It?

- “If it ain’t broke...” vs. Continuous Improvement

► Examples

Metering | Energy Dashboards and Reporting | Automation

COMMUNICATION (#5)

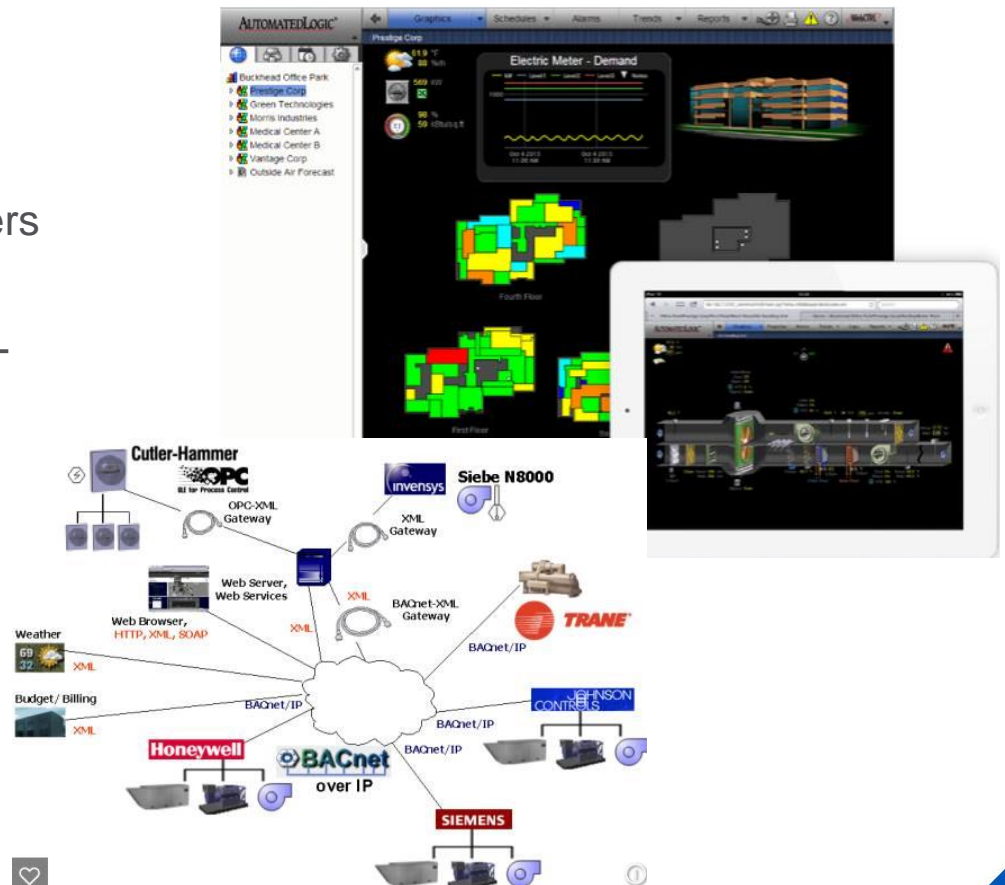

Metering & Energy Dashboards

COMMUNICATION (#5)

Automation

- Building Automation Systems (BAS)
- Plant Programmable Logic Controllers (PLC)
- Open Protocol Communication e.g. - BACnet
- Sophisticated User Interfaces
- Data Archiving
