

Combined Heat and Power as a Source of Resilience in Microgrids

Webinar
November 13th 2018

Welcome to the IDEA Webinar Series

- The webinar will start promptly at 2:00pm EDT (Boston time) and is scheduled to last sixty (60) minutes; including time for questions.
- Please mute your phone during the webinar. All lines are muted.
- If you are having problems with video or audio, please send a note via the Chat Box function on the right side. Click the Chat box and choose – “Chat privately to Cheryl Jacques (host)”. Or call to IDEA at +1-508-366-9339.
- Questions to Presenters: Please enter your Questions in the Q&A box at the lower right of the screen. These questions will be moderated and addressed as time allows. We plan to handle Q&A at the conclusion of the presentation.
- Survey: Please complete the brief on-line survey following the webinar.
- Webinar Download or Streaming: Webinar will be recorded and available via download or streaming. Slides will be made available in pdf format. Please visit www.districtenergy.org.

Upcoming IDEA Conferences

DistrictCooling2018

Efficient Energy for Smarter Cities

DECEMBER 9-11, 2018 - ATLANTIS, THE PALM - DUBAI, UAE

CampusEnergy2019

February 26 - March 1, 2019 | New Orleans, LA | Hilton New Orleans Riverside

IDEA2019

The Energy for More Resilient Cities

110TH ANNUAL CONFERENCE & TRADE SHOW | June 24-27
David L. Lawrence Convention Center and The Westin Convention Center | Pittsburgh, PA

Gavin Dillingham

Director of the DOE Southcentral CHP TAP

Carlos Gamarra

Energy Engineer with DOE Southcentral CHP TAP

Laxmi Rao - Moderator

Director, International District Energy Association

Partner

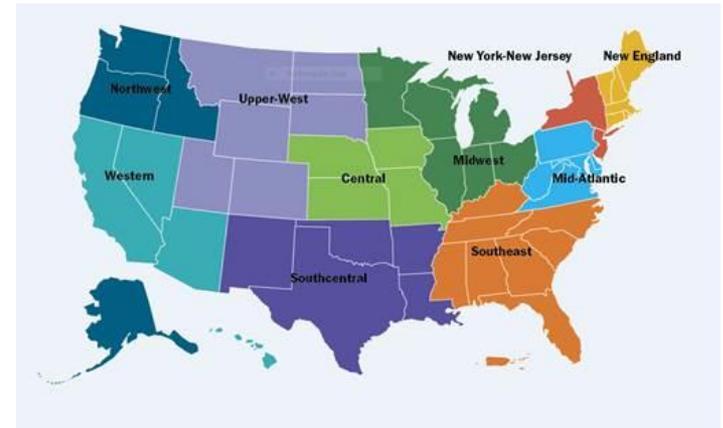

Agenda

- CHP Overview
- CHP Markets
- CHP Trends
- CHP Activity in the Southcentral Region
- CHP as a Source of Resilience in Microgrids
- Project Snapshots
- How to Implement a CHP Project with the Help of the CHP TAP

DOE CHP Technical Assistance Partnerships (CHP TAPs)

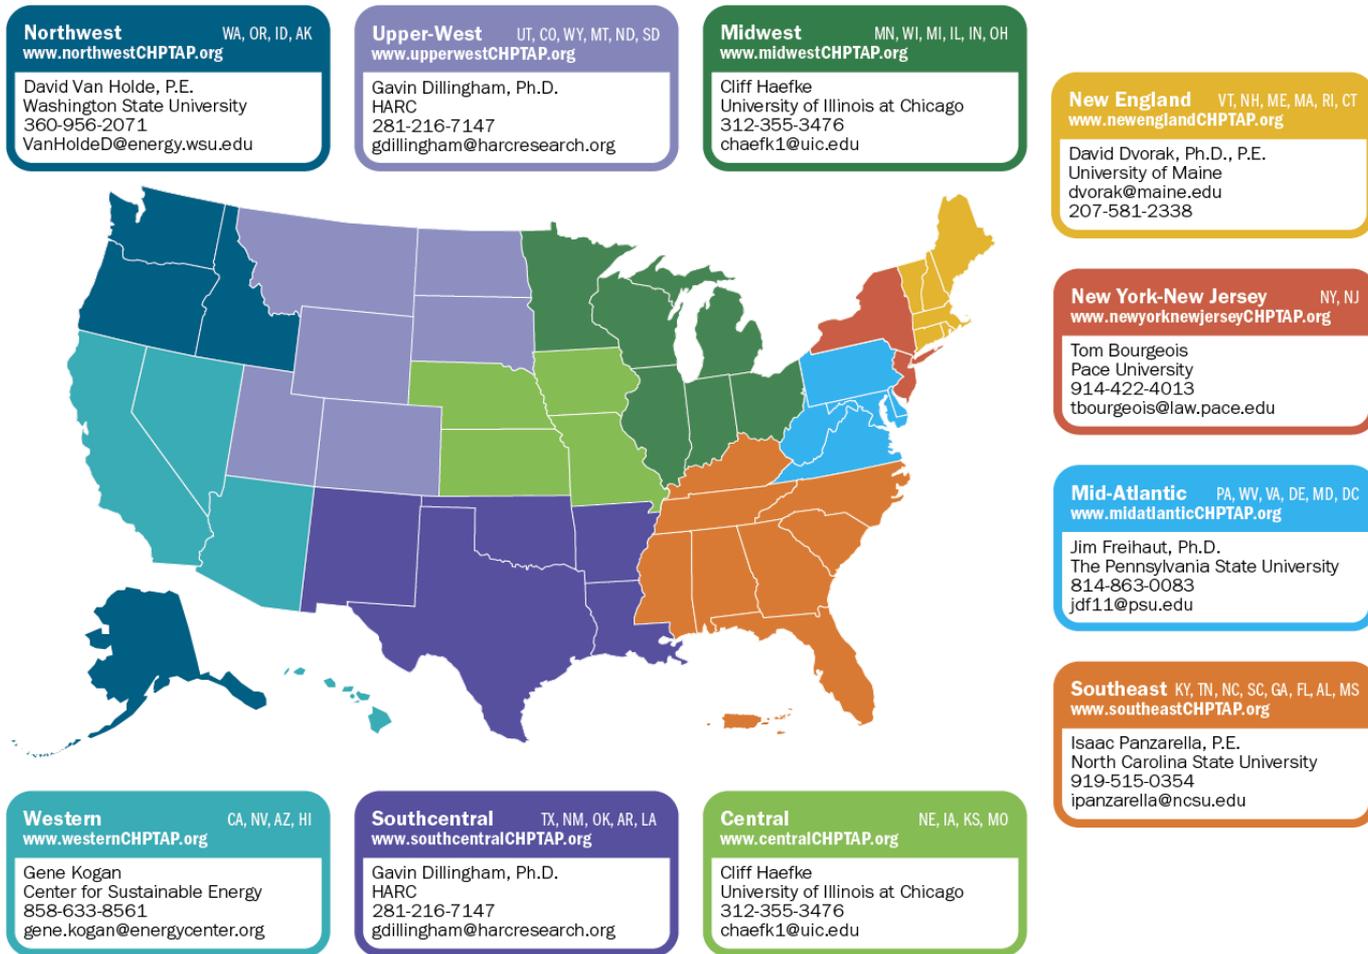

- **End User Engagement**
Partner with strategic End Users to advance technical solutions using CHP as a cost effective and resilient way to ensure American competitiveness, utilize local fuels and enhance energy security. CHP TAPs offer fact-based, non-biased engineering support to manufacturing, commercial, institutional and federal facilities and campuses.
- **Stakeholder Engagement**
Engage with strategic Stakeholders, including regulators, utilities, and policy makers, to identify and reduce the barriers to using CHP to advance regional efficiency, promote energy independence and enhance the nation's resilient grid. CHP TAPs provide fact-based, non-biased education to advance sound CHP programs and policies.
- **Technical Services**
As leading experts in CHP (as well as microgrids, heat to power, and district energy) the CHP TAPs work with sites to screen for CHP opportunities as well as provide advanced services to maximize the economic impact and reduce the risk of CHP from initial CHP screening to installation.

CHP Overview

CHP Technical Assistance Partnerships

SOUTHCENTRAL

CHP Recaptures Heat of Generation, Increasing Energy Efficiency, and Reducing GHGs

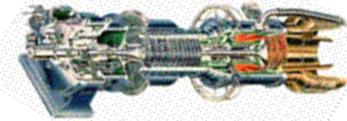

30 to 55% less greenhouse gas emissions

Common CHP Technologies

Microturbines

Gas Turbines

Reciprocating Engines

Fuel Cells

Steam Turbines

50 kW

100 kW

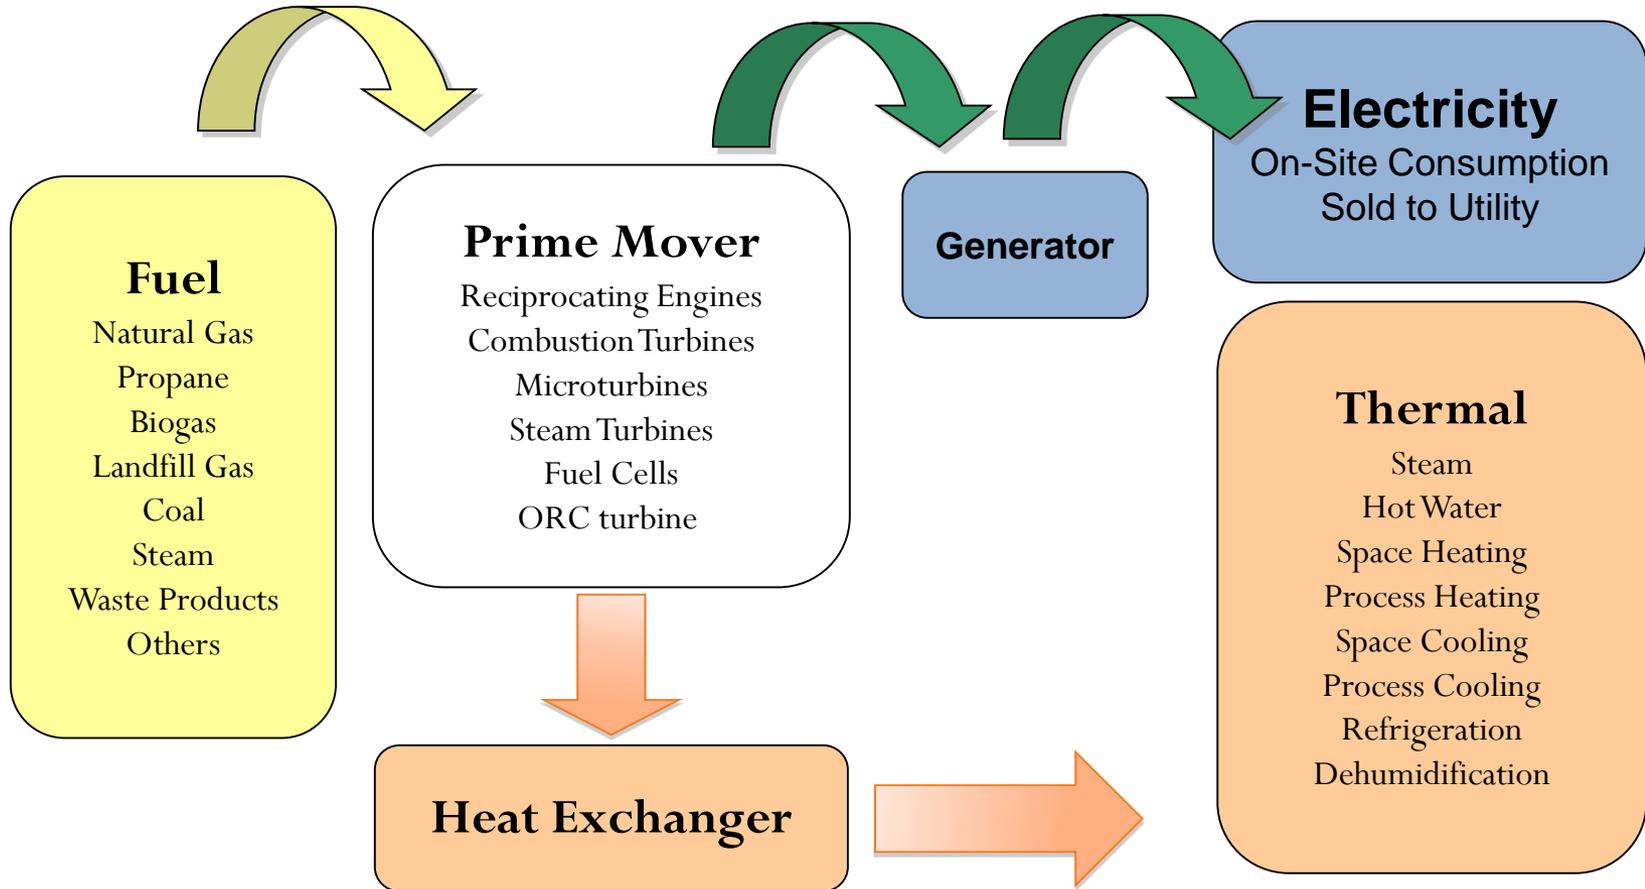

1 MW

10 MW

20 MW

CHP System Schematic

What Are the Benefits of CHP?

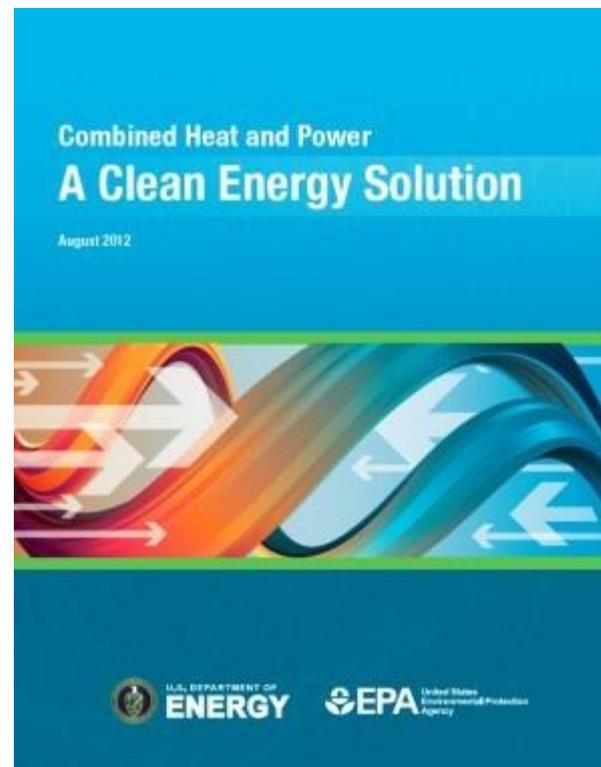

- CHP is **more efficient** than separate generation of electricity and heating/cooling
- Higher efficiency translates to **lower operating costs** (but requires capital investment)
- Higher efficiency **reduces emissions** of pollutants
- CHP can also increase **energy reliability** and enhance power quality
- On-site electric generation can **reduce grid congestion** and avoid distribution costs.

Emerging National Drivers for CHP

- Benefits of CHP recognized by policymakers
 - State Portfolio Standards (RPS, EEPS), Tax Incentives, Grants, standby rates, etc.
- Favorable outlook for natural gas supply and price in North America
- Opportunities created by environmental drivers
- Utilities finding economic value
- Energy resiliency and critical infrastructure

CHP as a Source of Resilience in Microgrids

Power Outages Are Costly

Study author	Parameters	Annual cost
Galvin Electricity Initiative (Rouse and Kelly 2011)	Cost of losses due to power outages	\$150 billion (about 4 cents for every kWh consumed nationwide)
Lawrence Berkeley National Laboratory (LaCommare and Eto 2006)	Cost of poor energy reliability and poor power quality	\$79 billion
Hartford Steam Boiler and Atmospheric and Environmental Research (AER and HSB 2013)	Cost of power outages	\$100 billion
Executive Office of the President (2013)	Cost of weather-related outages over five minutes	\$18–33 billion
Institute of Electrical and Electronics Engineers (Bhattacharyya and Cobben 2011)	Cost of poor power quality	\$119–188 billion
Electric Power Research Institute (EPRI) (Hampson et al. 2013)	Cost of outages to “industrial and digital economy” businesses	\$45.7 billion
EPRI (Hampson et al. 2013)	Cost of outages to entire US economy	\$120–190 billion
US Congressional Research Service (Campbell 2012)	Cost of weather-related outages longer than five minutes	\$25-70 billion

Source: ACEEE (2017) Valuing Distributed Energy Resources: Combined Heat and Power and the Modern Grid

CHP Design for Resilience

- One estimate states that over \$150 billion per year is lost by U.S. industries due to electric network reliability problems
- CHP systems designed for reliability will incur additional costs (\$45 - \$170/kW depending on complexity of system)
- CHP (if properly configured):
 - ✓ Can generate energy savings in your daily operations
 - ✓ Offers the opportunity to improve CI resiliency, supplying electricity and heating/cooling to the host facility during a disaster.

CHP: Proven to be Resilient

■ Hurricane Harvey

- University of Texas Medical Branch (UTMB), Galveston, TX, 2 7.5 MW gas turbines
- Texas Medical Center, Houston, TX (owned and operated by Thermal Energy Corporation), 48 MW gas turbines

■ Hurricane Irma and Maria

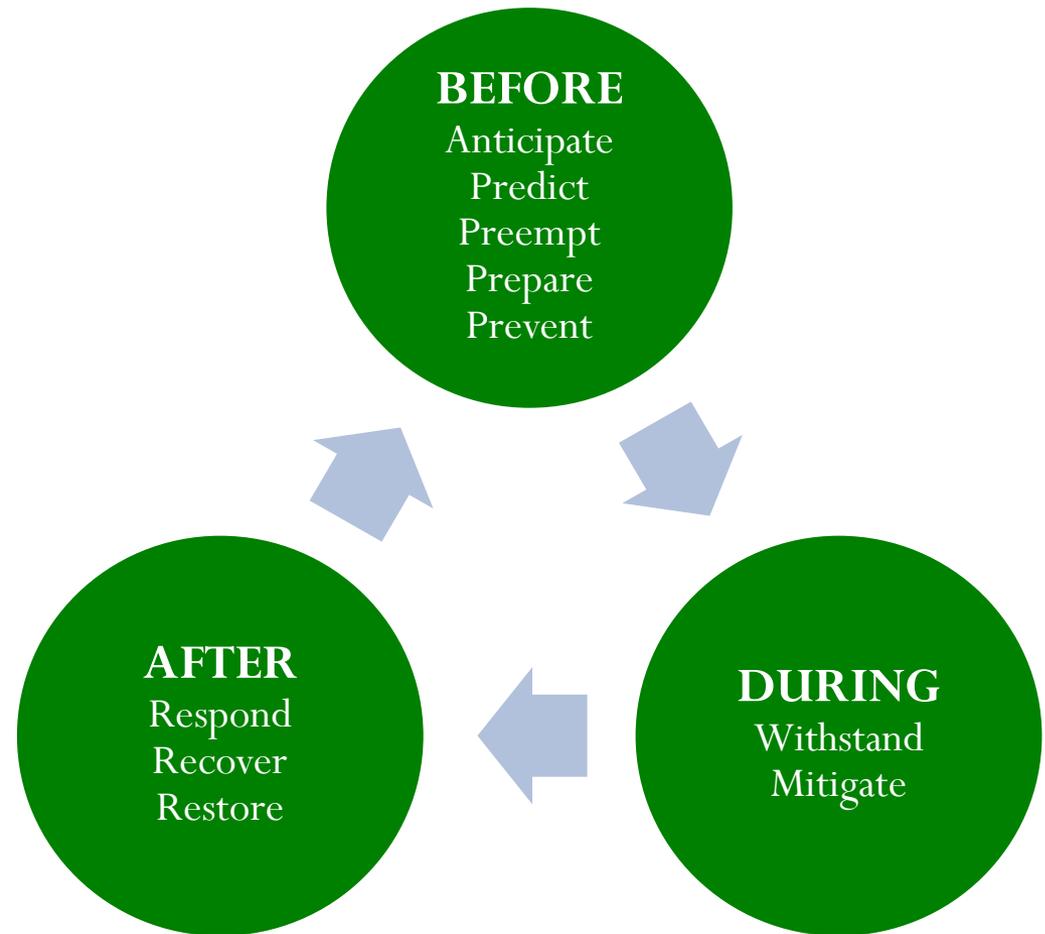

- University of Florida- Shands Medical Center – Gainesville, FL, 4.3 MW CHP gas turbine
- Baptist Medical Center South, Jacksonville, FL – 3.5 MW reciprocating engine CHP system and backup generators
- Hospital De La Concepcion, San German, Puerto Rico, 1.2 MW reciprocating engine
- Matosantos Commercial Corp., Vega Baja, PR – food processing facility - 2 MW propane fueled reciprocating engine

Infrastructure Resilience

What is RESILIENCE?

- **Resilience (engineering)** is the ability to absorb or avoid damage without suffering complete failure.
- **Human resilience (psychology)** is the capacity to make realistic plans and take steps to carry them out.

Distributed Energy Resources Disaster Matrix

Ranking Criteria

Four basic criteria were used to estimate the vulnerability of a resource during each type of disaster event. They include the likelihood of experiencing:

1. a fuel supply interruption,
2. damage to equipment,
3. performance limitations, or
4. a planned or forced shutdown

-  indicates the resource is unlikely to experience any impacts
-  indicates the resource is likely to experience one, two, or three impacts
-  indicates the resource is likely to experience all four impacts

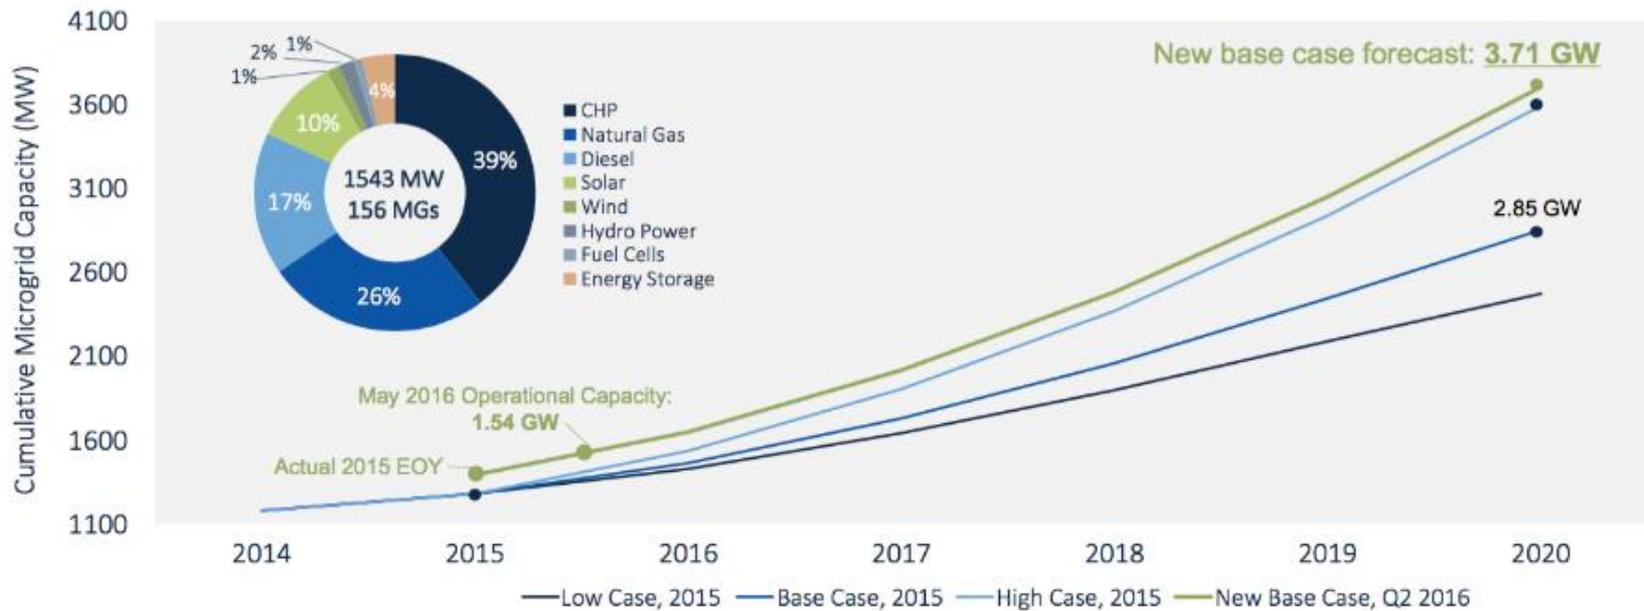

Natural Disaster or Storm Events	Flooding	High Winds	Earthquakes	Wildfires	Snow/Ice	Extreme Temperature

US MG Market Evolution

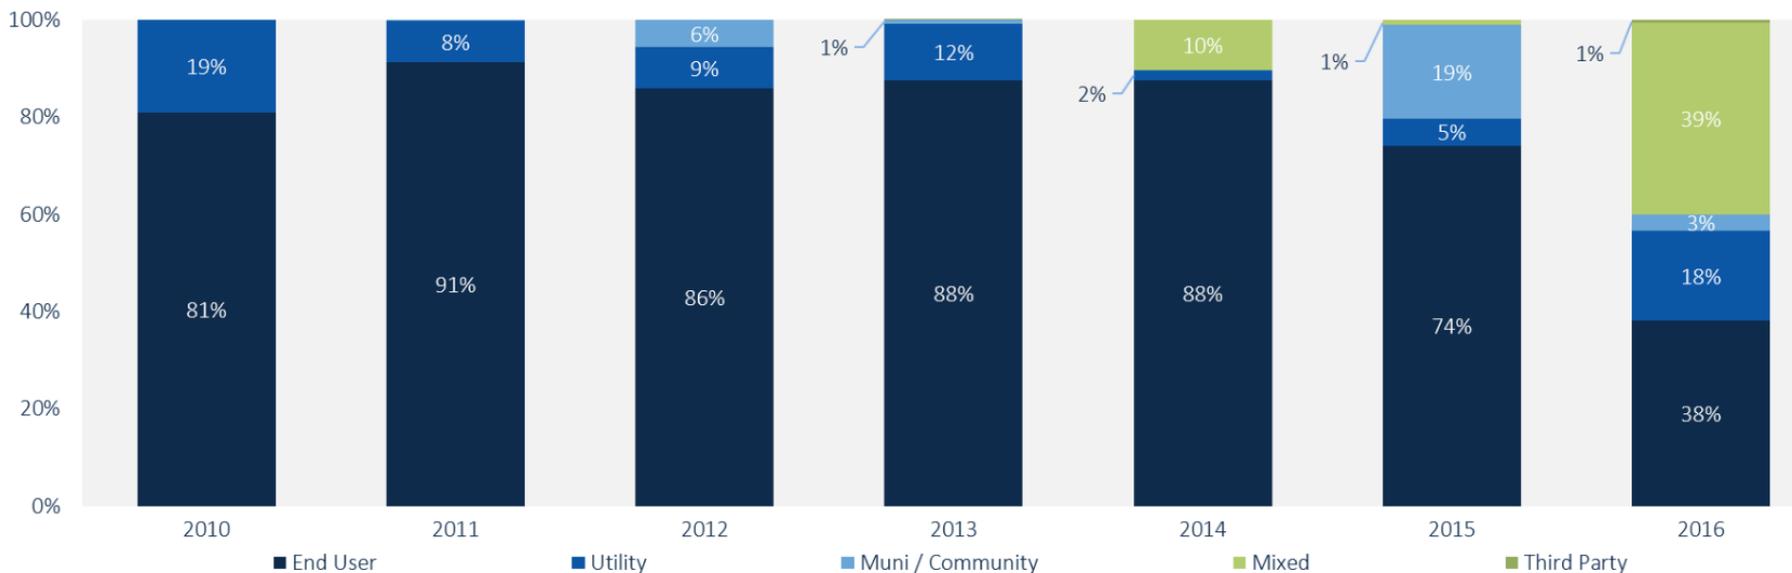

- Market research companies are updating their forecasts.
- The MG market is expected to reach 3.71 GW of operational capacity in 2020.
- **In 2Q 2016 39% of the existing microgrids are based on CHP systems.**

US MG Market Evolution

Map of Operational Microgrid Deployments by End-User Type Across the Continental U.S.*

Source: GTM Research, U.S. Microgrid Tracker Q3 2017

* The size of the bubbles correspond with the total capacity (MW) installed in that location.

** Microgrids are mapped based on city location; when multiple microgrids are in the same city they may get the multiple end user designation. In some cases for data privacy, data is given at a state or national level. In these cases, the microgrids are mapped at the center of the state.

The role of microgrids in the future power grid

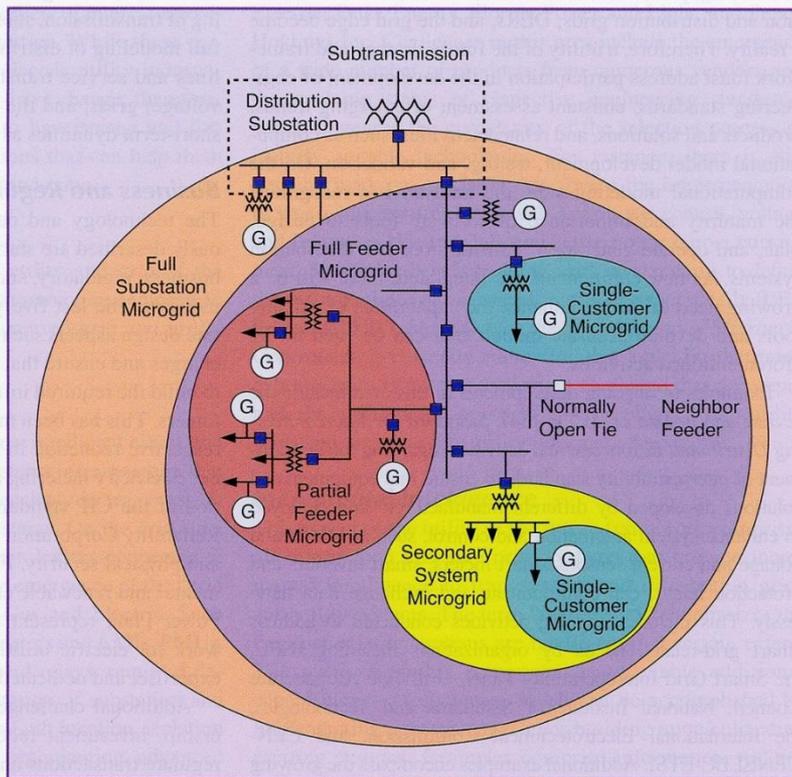

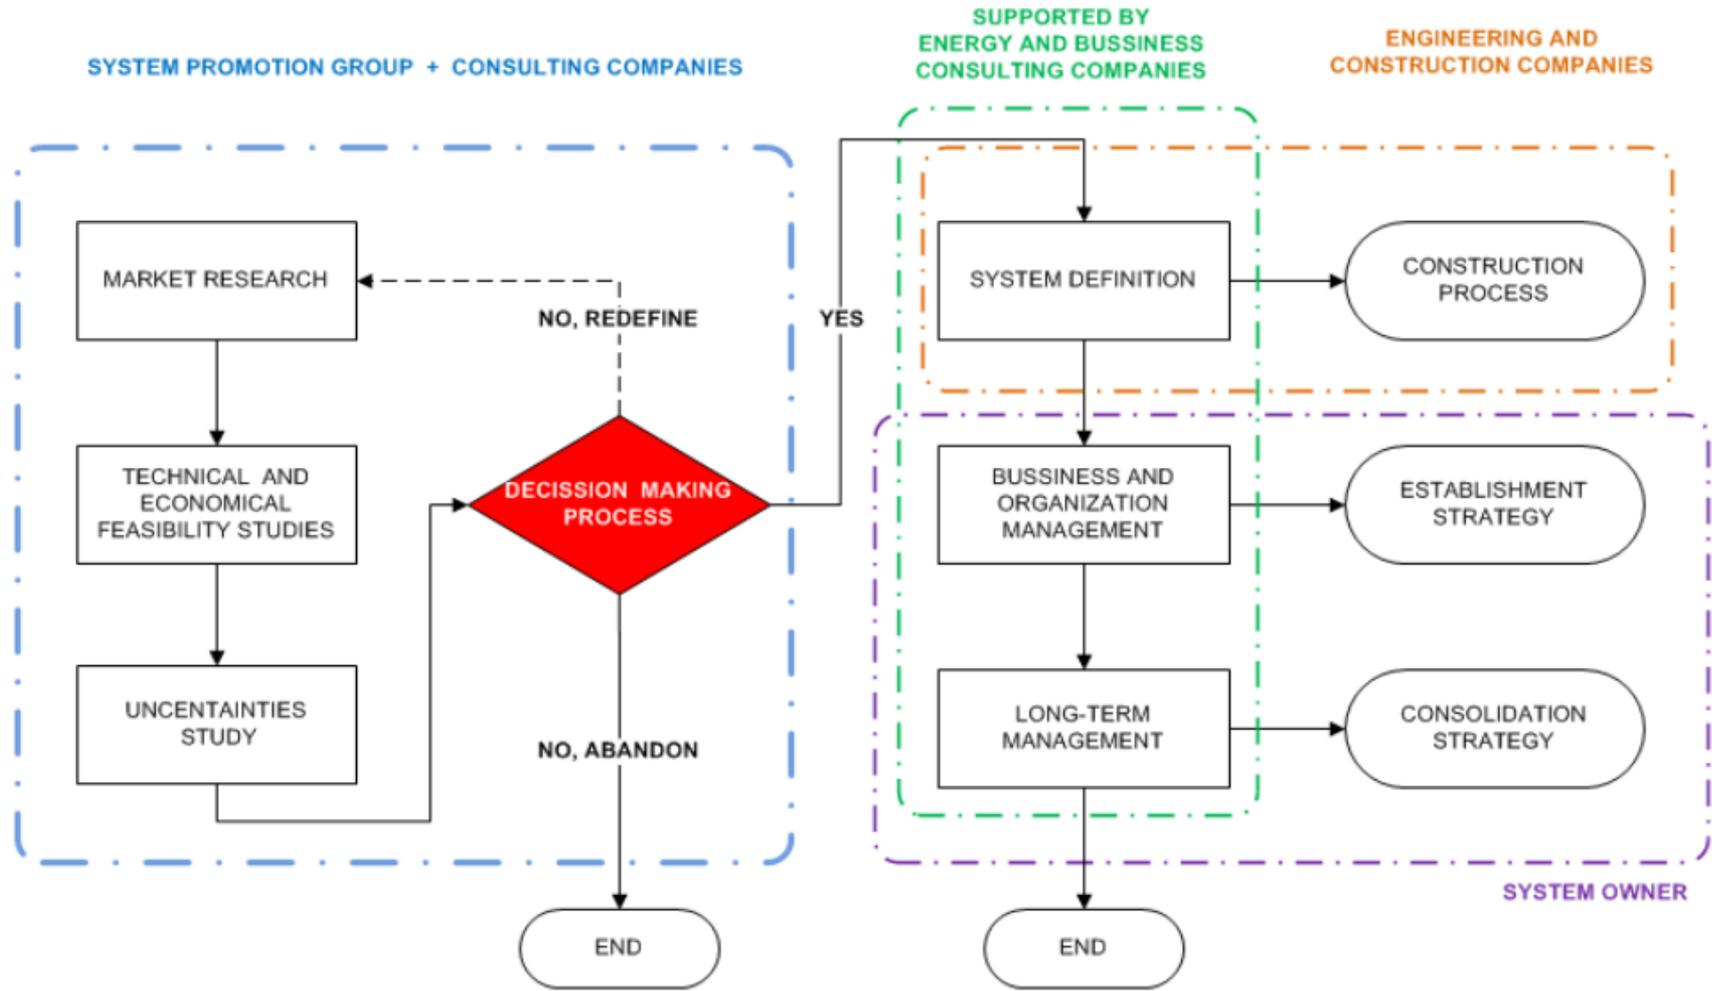

figure 3. This hierarchical microgrid is an example of the grid architectures being explored to enable the highly distributed grid concept and maximize reliability and resiliency under a wide variety of contingency conditions and locations as well as DER and load-balance scenarios. (Source: Sandia National Laboratory.)

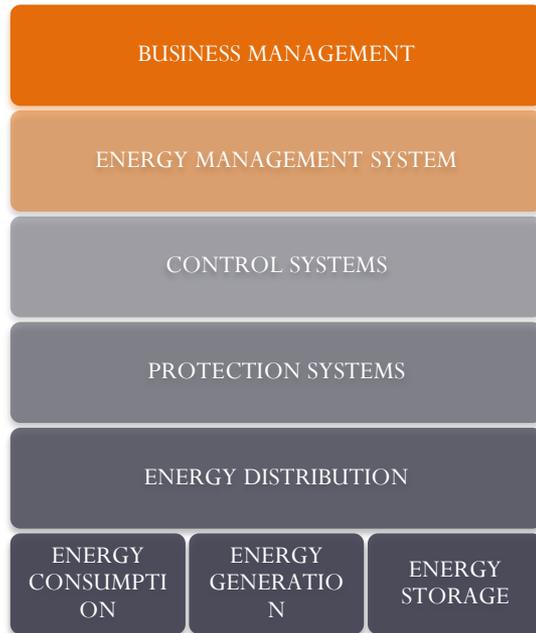

SOURCE: *IEEE POWER & ENERGY*. Vol.14, Number 5, September/October 2016

- Regarding the other power systems A MICROGRID can:
 - **Coexist:** as individual power systems
 - **Cooperate:** take part of other microgrids or work as part of the distribution grid
 - **Compete:** as individual power system
- No massive establishment: only those based on competitive advantages or added value proposals.
- Is there a microgrid for every company? **YES**
- Is it worth exploring your possibilities to have a MG? **YES**
- Make sense for every company to have their own microgrid? **NO**

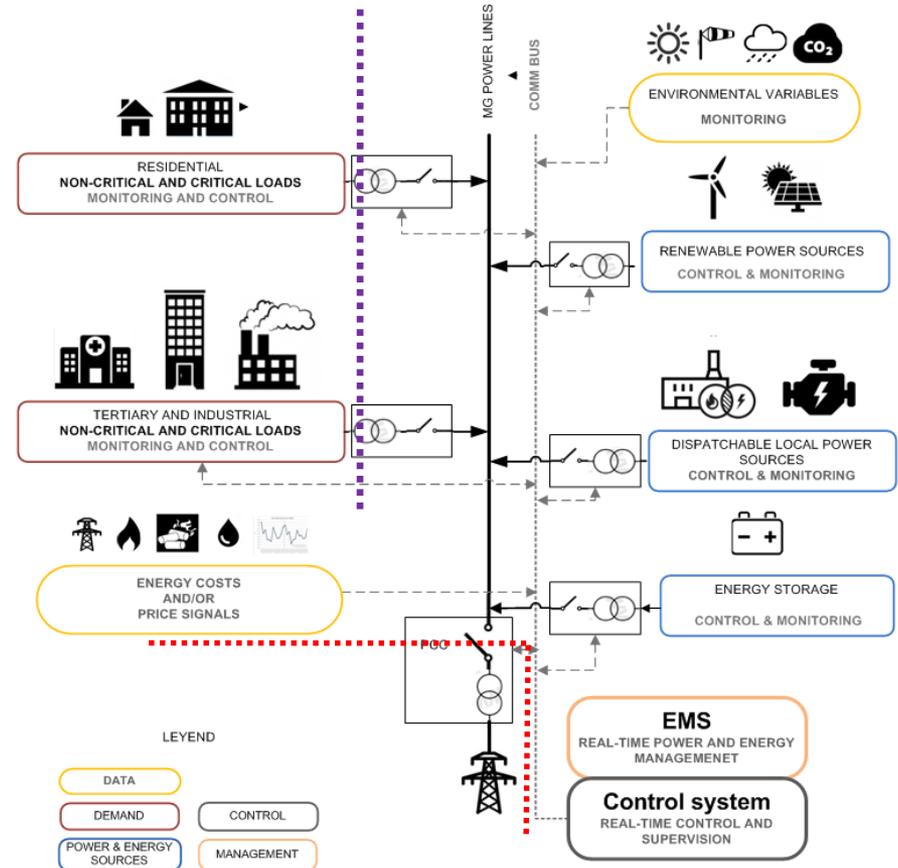

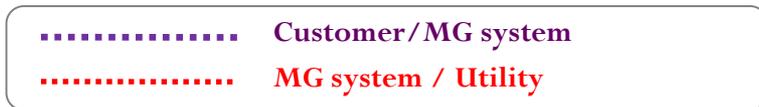

A Potentially Complex Planning Process...

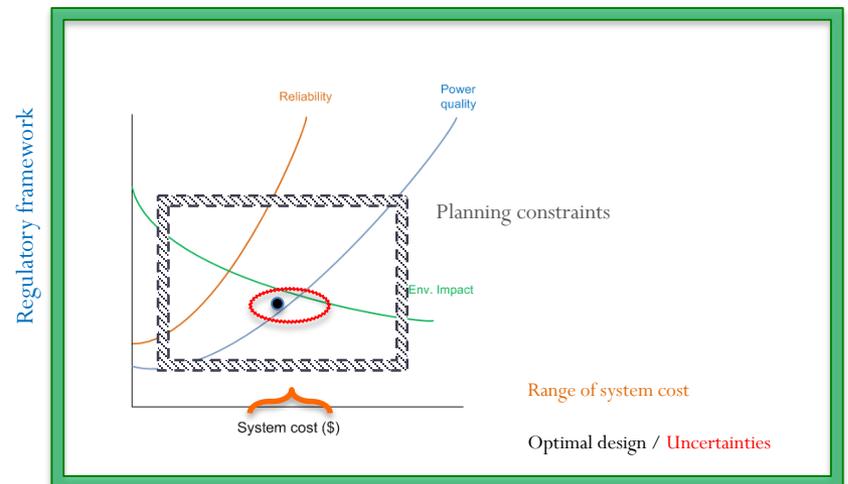

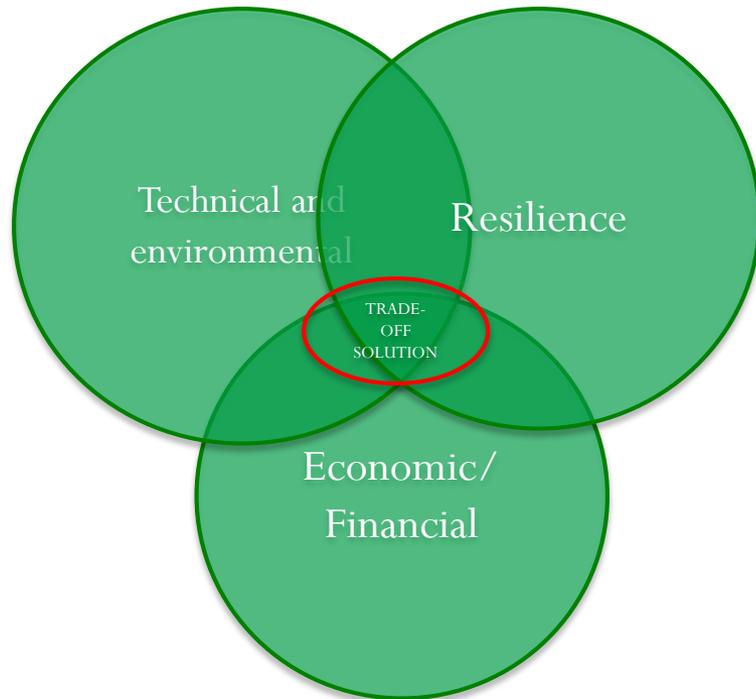

A Potentially Complex Planning Process...

Frontier points

...With Not a Single Solution

Trends in microgrid planning

- A microgrid planning process is a study of present and future profitability scenarios.
- Design and planning stages must be strongly focused around specific goals: save money, save energy, save environmental emissions, improve resilience, etc.
- Specific competitive advantages must be the basis of the planning process.
- Incentives will support the system only in the short-term.
- Tailored solutions vs modular MG.
- Data mining and machine learning based design and management strategies
- Planning tools not available for ever kind of microgrid → **tailored models**

Project Snapshots

Project Snapshot:

Energy Security, Resiliency, Federal Mandates

White Oak FDA Campus
Silver Spring, MD

Application/Industry: Federal

Capacity: 26 MW

Prime Mover: Reciprocating engine, gas turbine

Fuel Type: Natural gas

Thermal Use: Heating and cooling

Installation Year: 2004

Emissions Savings: 50,000 metric tons CO₂ - equivalent

Highlights: The current CHP system:

- Has 26 MW power supply (currently being expanded to 55 MW to handle the site's peak load)
- Works in parallel with the utility under a three-party interconnect agreement
- Participates in demand response events
- Utilizes spinning reserve to maintain energy reliability
- Can island and operate mission critical functions independent from the grid
- Can match load to supply

CHP Technical Assistance Partnerships

SOUTHCENTRAL

Slide prepared 6/2017

Project Snapshot:

Energy Cost Savings – Microgrid

Marine Corps Air Ground Combat Center
Twentynine Palms (MCAGCC)
Twentynine Palms, CA

Application/Industry: Military Base

Capacity: 7.2 MW (9.2 MW expansion)

Prime Mover: Gas turbines

Fuel Type: Natural gas, diesel

Thermal Use: Heating and cooling

Installation Year: 2003, 2014

Emissions Savings: Reduces CO₂ emissions by
19,700 tons/year

Highlights: The 7.2 MW CHP system earned the 2012 Energy Star CHP Award. The base decided to add another 9.2 MW of CHP in 2014 that is all tied to a microgrid that incorporates CHP, solar PV, fuel cells, backup generators, and storage, meeting 90% of the base's power requirements.

How to Implement a CHP Project with the Help of the CHP TAP

CHP TAP Role: Technical Assistance

Quick screening questions with spreadsheet payback calculator; Advanced technical assistance to explore equipment or operational scenarios.

Perform 3rd Party reviews of site feasibility assessments: Estimates on savings, installation costs, simple paybacks, equipment sizing, and type.

Perform 3rd Party reviews of Engineering Analysis. Review equipment sizing and choices.

Review specifications and bids.

DOE TAP CHP Screening Analysis

High level assessment to determine if site shows potential for a CHP project

Qualitative Analysis

- Energy Consumption & Costs
- Estimated Energy Savings & Payback
- CHP System Sizing

Quantitative Analysis

- Understanding project drivers
- Understanding site peculiarities

Annual Energy Consumption	Base Case	CHP Case
Purchased Electricity, kWh	88,250,160	5,534,150
Generated Electricity, kWh	0	82,716,010
On-site Thermal, MMBtu	426,000	18,872
CHP Thermal, MMBtu	0	407,128
Boiler Fuel, MMBtu	532,500	23,590
CHP Fuel, MMBtu	0	969,845
Total Fuel, MMBtu	532,500	993,435
Annual Operating Costs		
Purchased Electricity, \$	\$7,060,013	\$1,104,460
Standby Power, \$	\$0	\$0
On-site Thermal Fuel, \$	\$3,195,000	\$141,539
CHP Fuel, \$	\$0	\$5,819,071
Incremental O&M, \$	\$0	\$744,444
Total Operating Costs, \$	\$10,255,013	\$7,809,514
Simple Payback		
Annual Operating Savings, \$		\$2,445,499
Total Installed Costs, \$/kW		\$1,400
Total Installed Costs, \$/k		\$12,990,000
Simple Payback, Years		5.3
Operating Costs to Generate		
Fuel Costs, \$/kWh		\$0.070
Thermal Credit, \$/kWh		(\$0.037)
Incremental O&M, \$/kWh		\$0.009
Total Operating Costs to Generate, \$/kWh		\$0.042

Screening Questions

- Do you pay more than \$.06/kWh on average for electricity (including generation, transmission and distribution)?
- Are you concerned about the impact of current or future energy costs on your operations?
- Are you concerned about power reliability?
What if the power goes out for 5 minutes... for 1 hour?
- Does your facility operate for more than 3,000 hours per year?
- Do you have thermal loads throughout the year?
(including steam, hot water, chilled water, hot air, etc.)

Screening Questions (cont.)

- Does your facility have an existing central plant?
- Do you expect to replace, upgrade, or retrofit central plant equipment within the next 3-5 years?
- Do you anticipate a facility expansion or new construction project within the next 3-5 years?
- Have you already implemented energy efficiency measures and still have high energy costs?
- Are you interested in reducing your facility's impact on the environment?
- Do you have access to on-site or nearby biomass resources?
(i.e., landfill gas, farm manure, food processing waste, etc.)

Table 1. Summary of Gas Turbine Attributes

Attribute	Description
Size range	Single cycle turbines are available in sizes ranging from 100 kW to 100 MW. Combined cycle turbines are available in sizes ranging from 100 kW to 100 MW.
Efficiency	Gas turbines produce high efficiency power, and thermal efficiency can be improved from the exhaust to produce steam, hot water, or chilled water (with an absorption chiller). The exhaust can also be used directly for industrial process heating or heating.
Flexibility	The start-up generation efficiency of gas turbines declines significantly as the load increases. Therefore, gas turbines provide the best economic performance in base load applications where the exhaust is used for industrial process heating or heating.
Reliability	Gas turbines can be operated with a wide range of gas and fuel oils. For CHP, natural gas is the most common fuel.
Modularity	Gas turbines are available in various configurations with high reliability.
Control	Gas turbines have relatively low emissions and require no cooling. Gas turbines are widely used in CHP applications and have relatively low maintenance costs.

CHP Technical Assistance Partnerships
SOUTHCENTRAL

Summary

- CHP gets the most out of a fuel source, enabling
 - High overall utilization efficiencies
 - Reduced environmental footprint
 - **Reduced operating costs**
- CHP can be used in different strategies, including **critical infrastructure resiliency** and emergency planning
- **Proven technologies** are commercially available and cover a full range of sizes and applications

Next Steps

Contact Sountcentral CHP TAP for assistance if:

- ✓ Interested in having a Qualification Screening performed to determine if there is an opportunity for CHP at your site
- ✓ If you already have an existing CHP plant and interested in expanding it
- ✓ Need an unbiased 3rd Party Review of a proposal

Thanks to our Partner
