# Cooling Tower Filtration Systems Comparative Study

# Objective

# COOLING TOWER – SIDESTREAM FILTER SYSTEM

Figure 1.1. Cooling Tower Side stream Schematic

# COOLING TOWER – SIDESTREAM FILTER SYSTEM

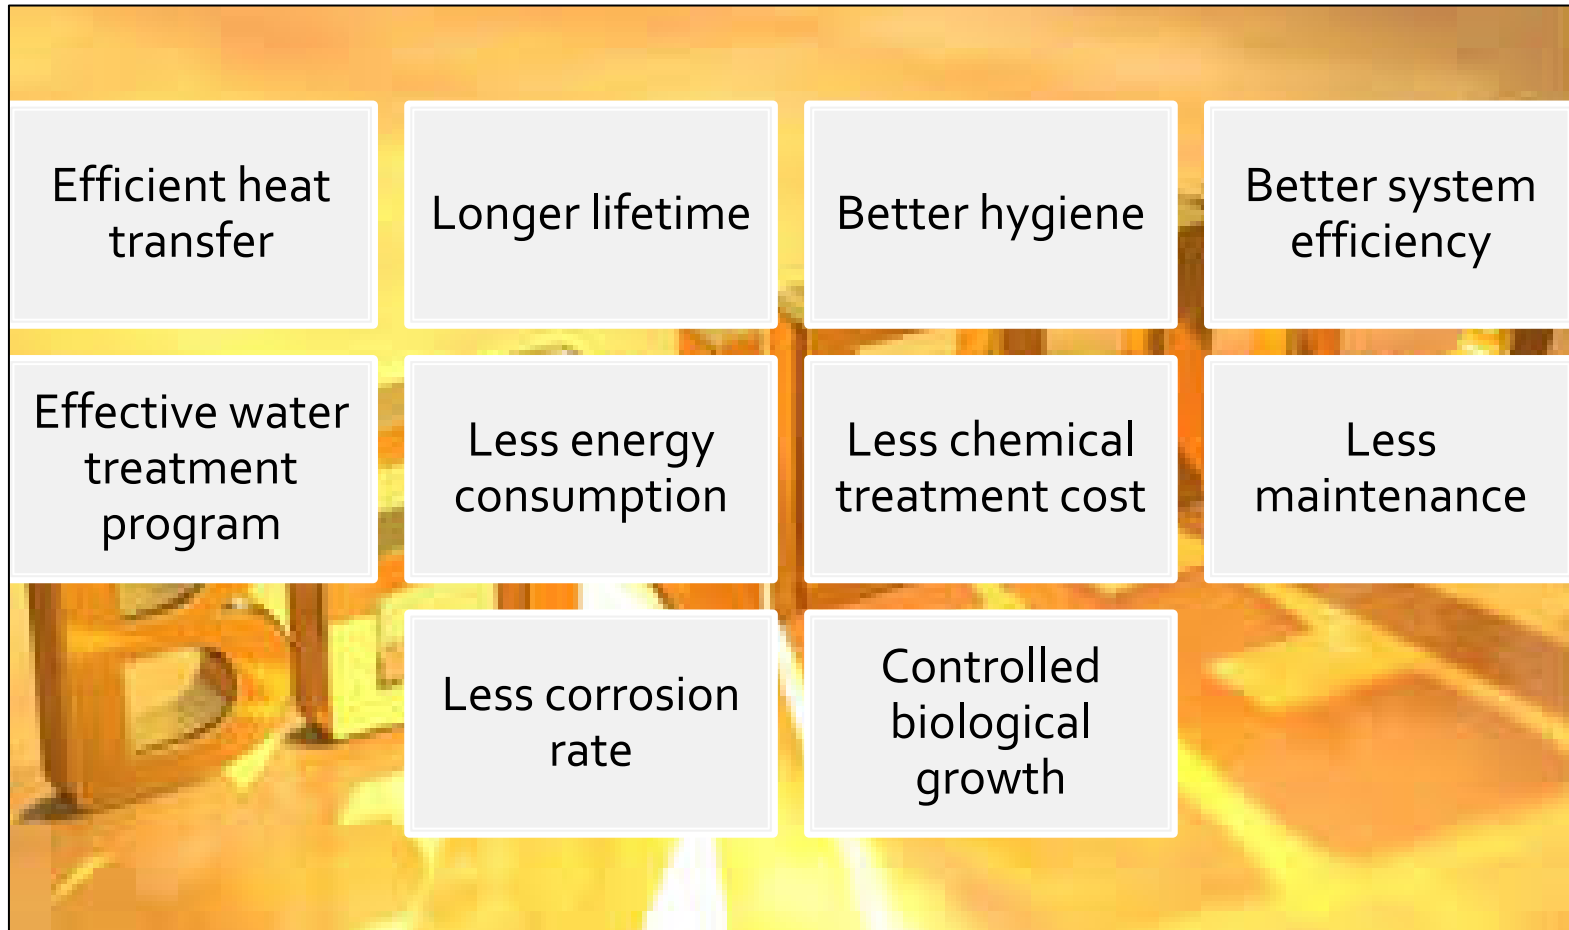

Figure 1.2. Cooling Tower with Side Stream Filtration

# SIDE STREAM FILTERS BENEFITS

# KEY ELEMENTS

Particle  
removal level

Self-cleaning  
function

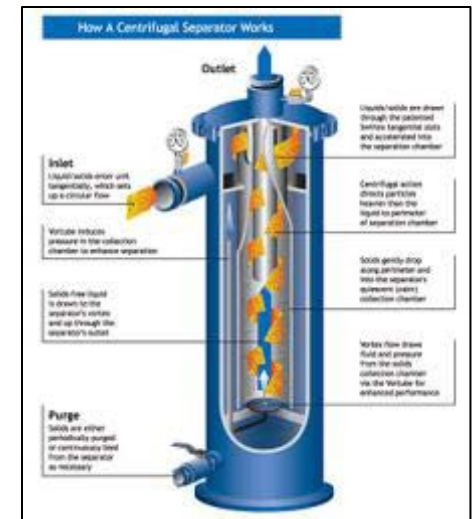

Outlet (water  
loss)

Ease of  
operation

# SIDE STRAM FILTERS TYPES

- Centrifugal separators
- Bag filters
- Screen filters
- Disc filters

# CENTRIFUGAL SEPERATORS

A filter that removes solids from water by the centrifugal force developed as water passes through the device.

## Advantages :

- Less maintenance & Replacement
- Virtually zero water discharge

## Disadvantages :

- Longer to discharge tiny particles.

Figure 2. Liquid centrifugal separator ,  
<https://commons.wikimedia.org/wiki>

# BAG FILTER

Figure 5. Bag Filter

A type of filter that works by the principle of microfiltration where it purifies the liquid in bags by passing small permeable pores.

### Advantages :

- Less expensive
- Flexible adjustment
- Increased available surface area that can effectively remove larger amounts of corrosion debris
- Handling higher flow rates
- Reduced energy costs

### Disadvantages :

- Required regular replacement
- Higher running cost

# SCREEN FILTER (Self-Cleaning)

Figure 4. Screen Filter

A type of filter that uses a flexible screen to separate sand and other fine particles out of water for irrigation or industrial application

## Advantages :

- Relatively inexpensive.
- High removal efficiency

## Disadvantages :

- Required frequent maintenance
- Higher back wash

# DISC FILTER

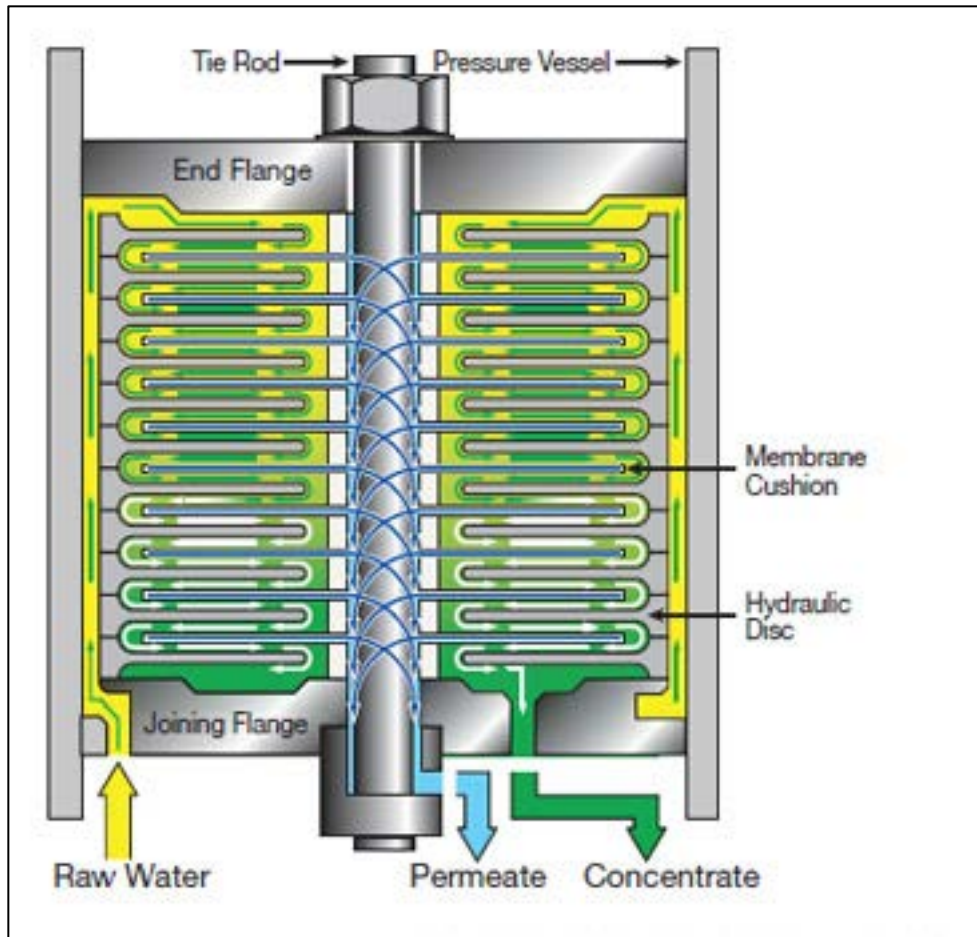

Figure 3. Disk Filter model

A technology that uses plastic discs made of polypropylene that are stacked together under pressure and grooved to filter particles of specific micron sizes.

## Advantages :

- Less maintenance
- Automatic Self-cleaning
- Remove both solids & organic effectively
- Lower operating cost

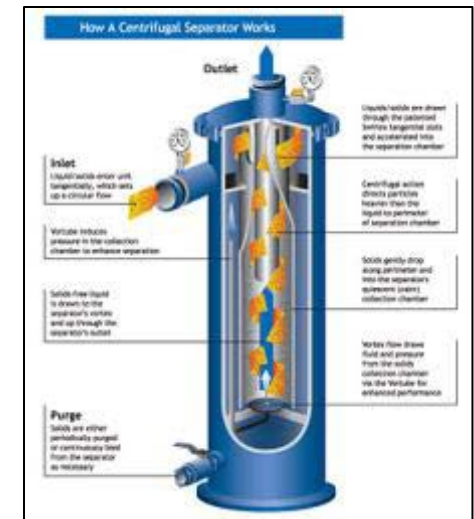

## Disadvantages :

- Moderate Filtration performance

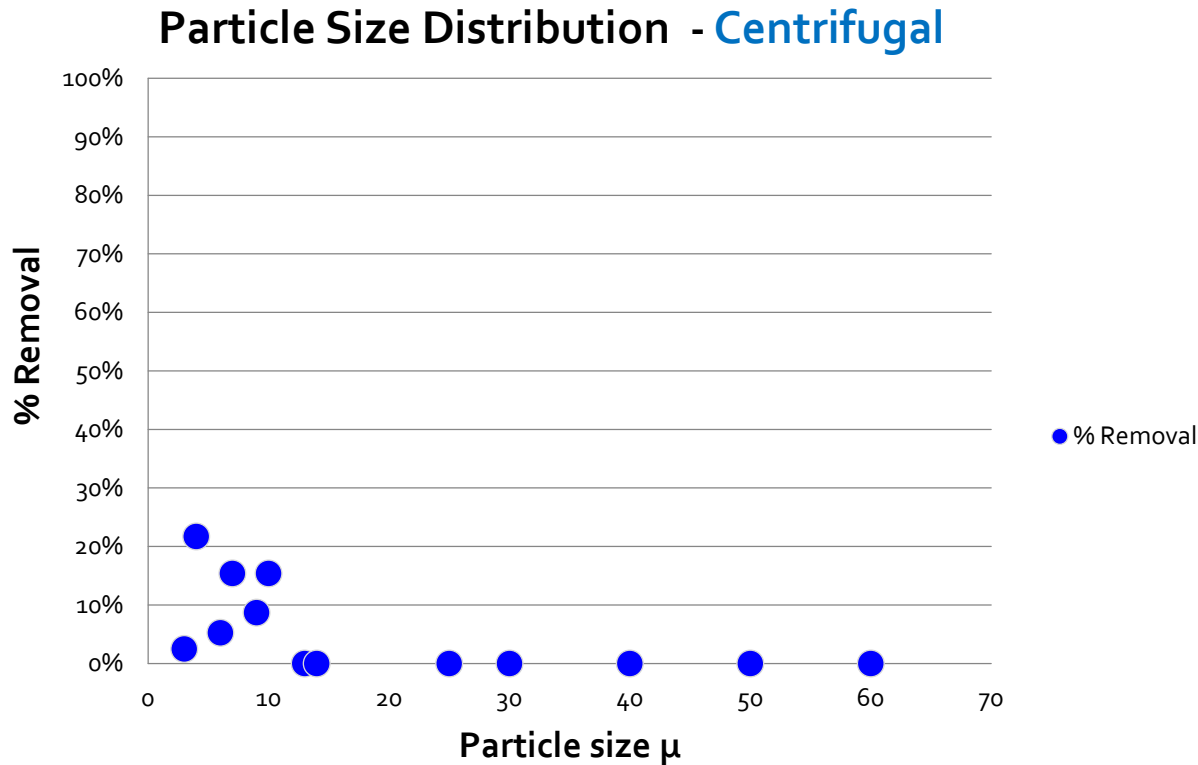

# Case Study

- Centrifugal separators
- Bag filters
- Screen filters
- Disc filters

# CENTRIFUGAL SEPERATOR (40-75 microns)

- Less efficiency at lower particle size
- Almost negligible backwash

# DISC FILTER (50 microns)

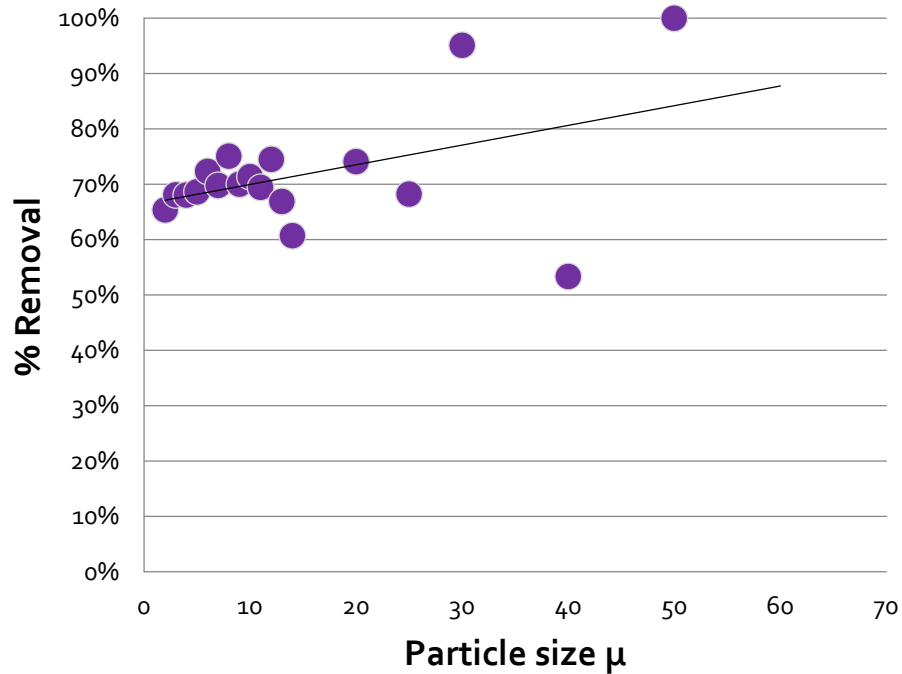

Particle Size Distribution - Disc Filter

- Higher efficiency than Centrifugal
- Removal up to 60% of particle lower than filter rating
- Has moderate backwash rate

# SCREEN FILTER (50 microns)

Particle Size Distribution - Screen Filter

- Highly efficient
- Removal up to 100% of particle at the filter rating.
- High back wash quantities

● % Removal  
— Linear (% Removal)

# BAG FILTER (10 micron)

Particle Size Distribution - Bag Filter

- Low efficiency
- No Backwash , but high running cost (consumables)

# CONCLUSION

| <b>FILTER TYPE</b>    | <b>PARTICLE REMOVAL %</b> | <b>ADVANTAGES &amp; DISADVANTAGES</b>                           |
|-----------------------|---------------------------|---|
| Centrifugal separator | 15%                       | Not suitable for removing lower size particles, less efficiency |
| Bag filter            | 20%                       | High running Cost (consumable)                                  |
| Screen Filter         | 100%                      | Water consuming   |
| Disc Filter           | 60%                       | Extremely efficiency, balanced back wash                        |
