Getting it all Together:

Planning and Delivery of a City District Energy Program

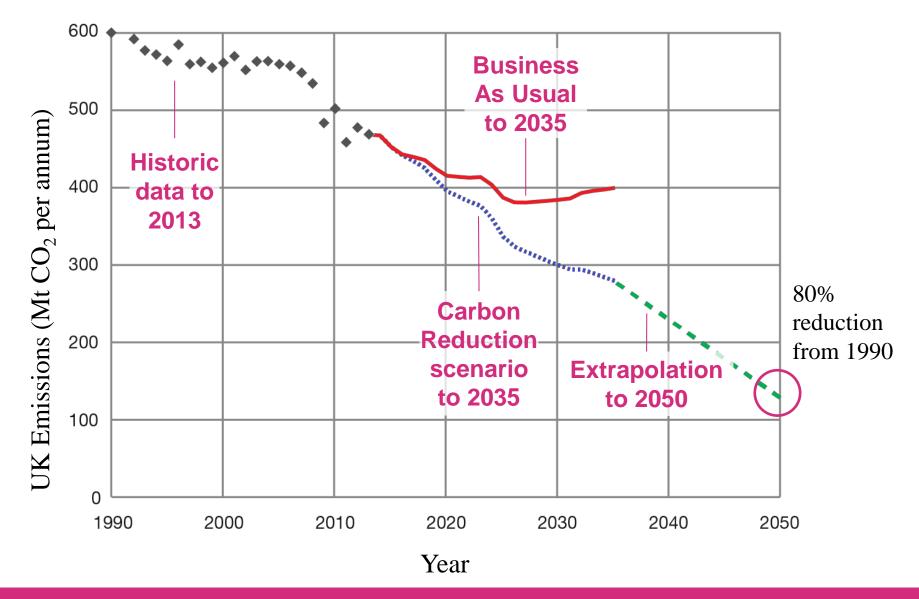

Stephen Cook IDEA Workshop: District Energy in Cities June 20, 2016

UK and London Policy Context

Carbon pathway for the UK

ARUP

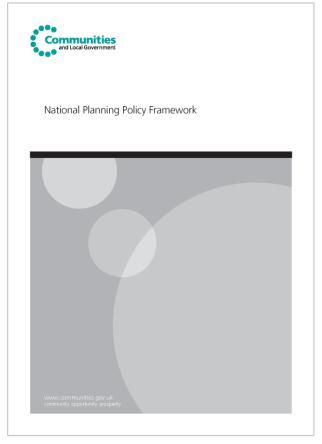

³ Arup's 7see energy-economy-employment modelling outputs

National scale: UK Government guidance to city governments

Local planning authorities should:

• Plan for new development in locations and ways which reduce greenhouse gas emissions

- Actively **support energy efficiency** improvements to existing buildings
- Be consistent with the **Government's zero carbon buildings policy** and adopt nationally described standards
- Identify **suitable areas for renewable and low carbon energy** sources, and supporting infrastructure

UK Government, National Planning Policy Framework, 2012

Energy Performance Certificates and Minimum Energy Efficiency Standards

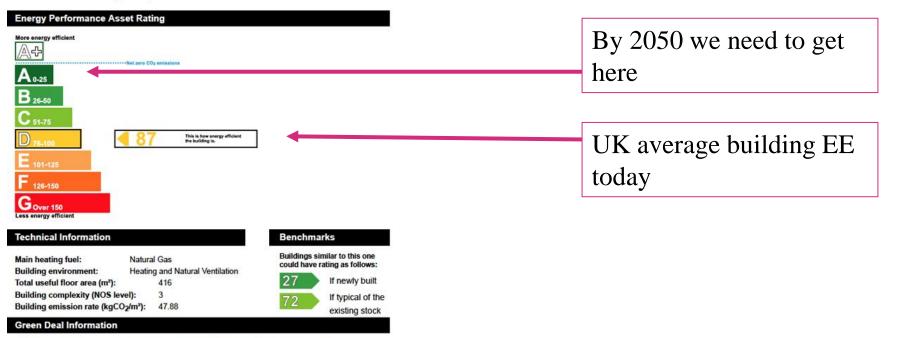

Energy Performance Certificate Non-Domestic Building	⊛HM	
Great James Street	Certificate Re	

WC1N 3HA

Certificate Reference Number: 0431-5990-9404-7002

Government

This certificate shows the energy rating of this building. It indicates the energy efficiency of the building fabric and the heating, ventilation, cooling and lighting systems. The rating is compared to two benchmarks for this type of building: one appropriate for new buildings and one appropriate for existing buildings. There is more advice on how to interpret this information on the Government's website www.communities.gov.uk/epbd.

The Green Deal will be available from later this year. To find out more about how the Green Deal can make your property cheaper to run, please call 0300 123 1234.

London Plan Energy Policy

Today:

- New development CO₂ emissions to be 35% below current national building standards (Part L 2013)
- Strong policy preference for heat networks

From October 2016:

- 35% standard still in place
- "Zero carbon homes:" Offset payment of £1800/tonne [~\$2500/ton], or £60/tonne x 30 years

DELIVERING LONDON'S ENERGY FUTURE

THE MAYOR'S CLIMATE CHANGE MITIGATION AND ENERGY STRATEGY OCTOBER 2011

MAYOR OF LONDON

From 2019:

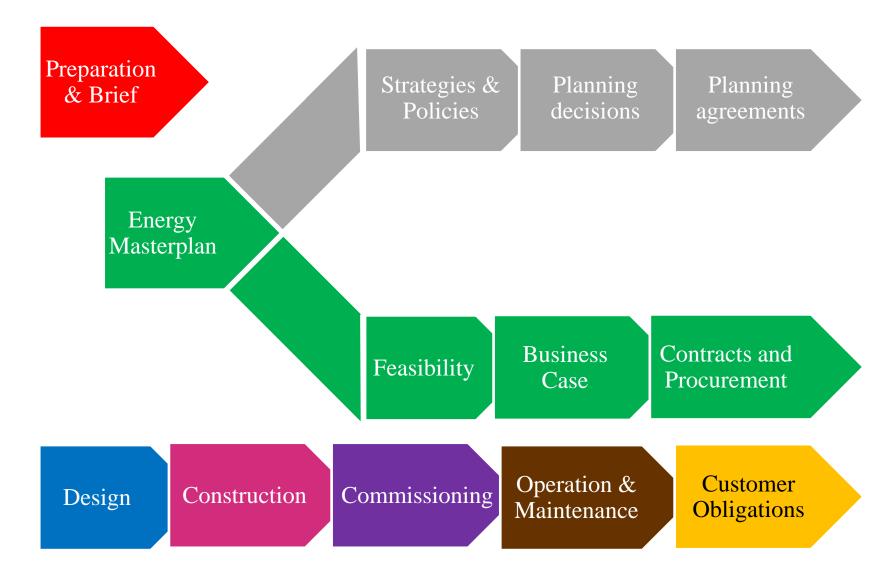

• "Zero carbon" non-domestic buildings

Experience of decentralised energy project delivery in London and UK

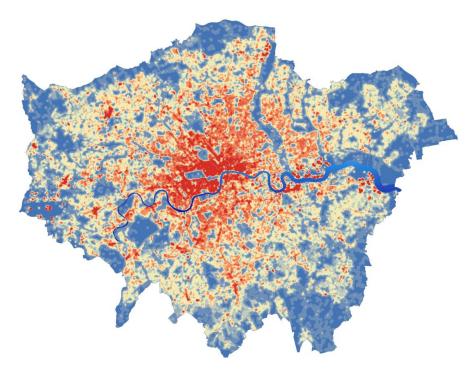

Decentralised Energy Delivery Pathways

DEMaP: London's Decentralised Energy Masterplanning Programme

- Boroughs given £15k to commission heat mapping
- DEMaP team provided technical support
- Total cost ca. £20k per heat map
- Training on energy masterplanning
- Significant capacity building

Outcomes of DEMaP

- **Corps of knowledgeable** local authority planners and energy officers
- Guidance documents on energy masterplanning and project delivery
- **Growing integration** between development planning and infrastructure investment
- A **pipeline** of decentralized energy projects

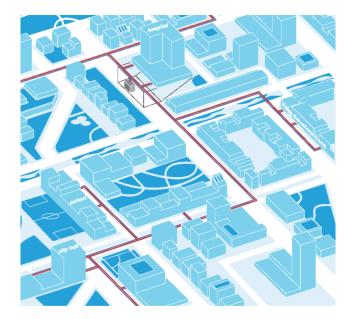

DEPDU: London Decentralised Energy Project Delivery Unit

• £3 million, 4-year **technical support programme**

- Focused on **DE project development** which is delivered as a free service to project sponsors.
- The programme operates through a **single delivery team** for the whole programme.
- Additional tasks for **standardizing practice** on heat networks in the UK

LONDON HEAT NETWORK MANUAL

MAYOR OF LONDON

Through project support

London Borough of Brent sought to **procure a heat network** and heat service for a 2500-home development site.

DEPDU support:

- Pre-feasibility
- Feasibility modelling
- Detailed technical advice
- Contractual advice
- Procurement support
- Drafting contract Heads of Terms

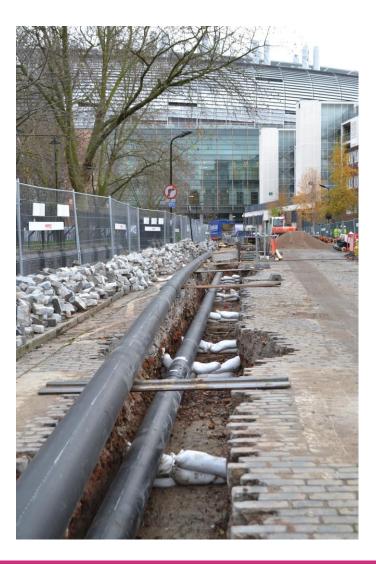

Municipal energy company delivery model

London Borough of Camden seeks to develop a heat network to connect its own existing apartment blocks.

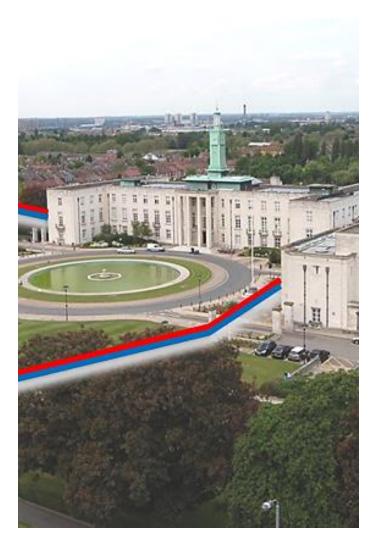

- Planning powers were key for catalyzing scheme.
- Camden elected to directly procure advice to complete the delivery of the project.

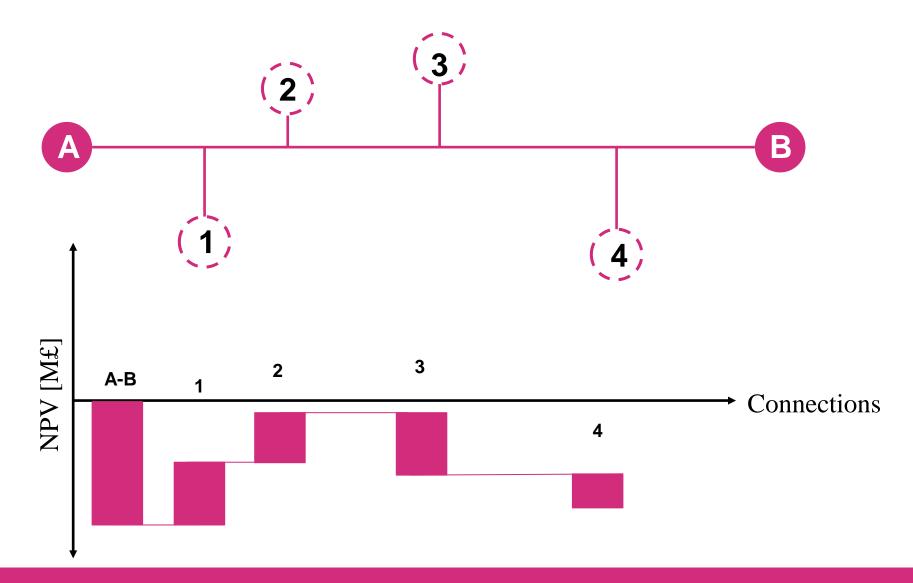

Challenges of suburban densities

- DEPDU analysed several opportunities in Waltham Forest in NE London.
- The area also provides limited potential for low carbon heat.
- Returns on investment tended to erode as the scheme grew due to relatively low densities of demand.
- A small network is being developed around a housing estate regeneration project.

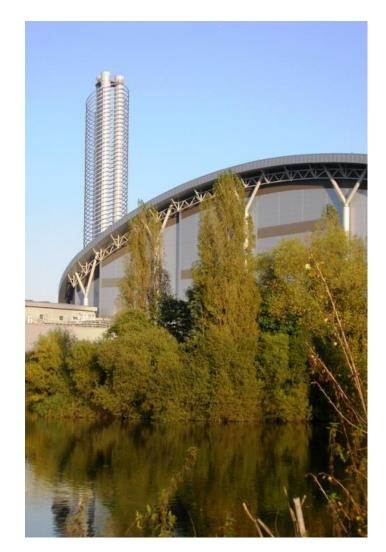

Project viability tipping point

Programme challenges

- Incentives for **cost-effective project** delivery could be better aligned between partners
- No **fund recovery** from successful projects
- **Programme support and project finance** could have been more closely linked.
- Success depended on sponsor's capacity and commitment
- Some projects supported in spite of evidence of **weak potential**

Successful programme features

- Over **£100 million** in project delivery secured
- Production of Heat Network
 Manual
- **Consistency of approach** to individual projects achieved through overarching programme and delivery manager
- Programme has **low transaction costs** for task instructions and allows for flexibility during task delivery

National Heat Network Delivery Unit (HNDU)

- National Heat Strategy highlights importance of heat networks to reducing CO₂ emissions
- National Heat Map produced
- Government unit provides grant funding and technical support to local authorities in deployment of heat networks
- Studies are procured by each local authority
- 180 projects, 115 cities and towns, \$15 million of grant funding

Department of Energy & Climate Change

Timeline of DE Delivery in the UK

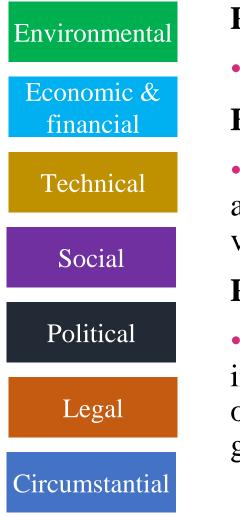

London Plan DE Planning Policy	• J • •	t ry Unit	(London Zero Carbon Planning Policy
2008 Lond			2014 ional Heat	2016 Heat Networks
DEMaP Programme (\$3 million)		Deli	works ivery Unit 5 million)	Infrastructure Fund launched (\$450 million)

Drivers of action on energy networks

Drivers of heat networks

Preparation & Brief Stage:

• Define drivers & assets

Feasibility and Business Case Stages:

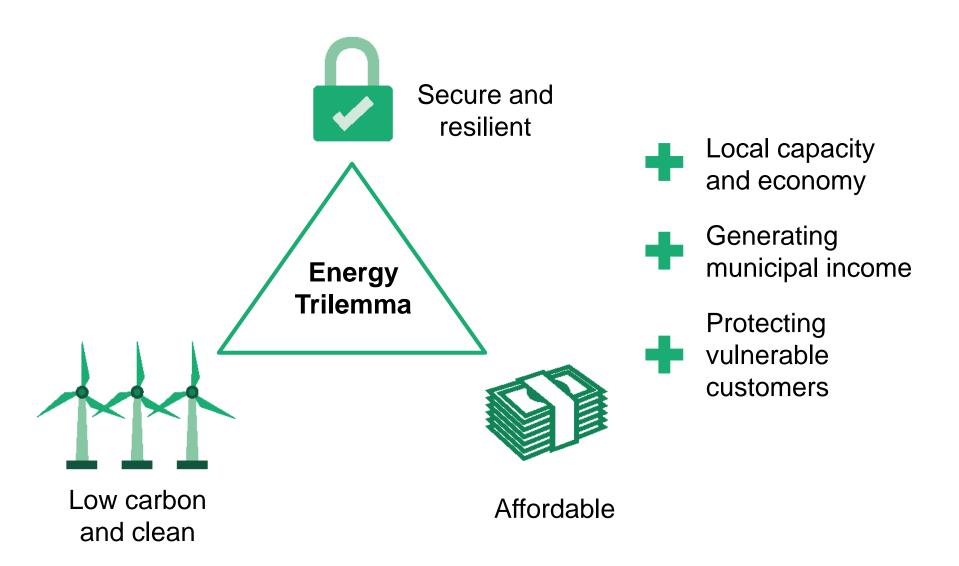

• Evaluate options against driver metrics (KPIs) and embed into decisions on funding, delivery vehicle etc.

Procurement, Delivery and Operation Stages:

• Embed drivers in contract documentation including service level agreements and other obligations. Incorporate performance KPIs and guarantees in payment and penalty mechanisms

Multiple drivers, balanced in a political context

Heat network in London

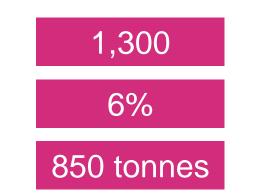

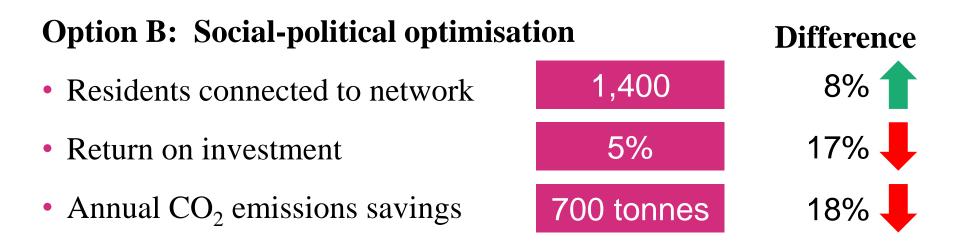

Heat network extension options

Option A: Technical-commercial optimisation

- Residents connected to network
- Return on investment
- Annual CO₂ emissions savings

Thank you

New Orleans Mayor Mitchell J. Landrieu

Evidence-based planning

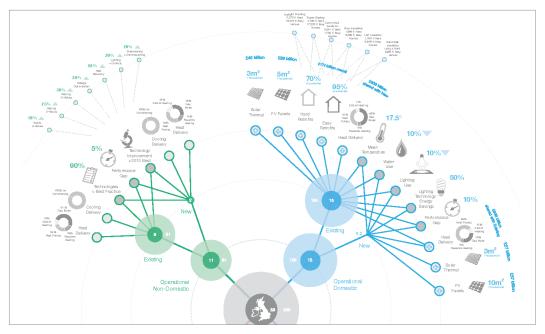

Energy Transition Planning in Cities

Cities have a key role to play in the shift towards a sustainable energy future.

The energy transition will not happen overnight. For the foreseeable future, cities will continue to rely on legacy systems and fossil fuels to help meet basic energy services including heating and transport. The transition process needs to be well thoughtout to guide the change, helping us go from where we are now to where we want to get to.

Modelling and Scenario Planning

Energy modelling and scenario planning will help cities set out targets and create realistic plans and programmes to transition to a low carbon future.

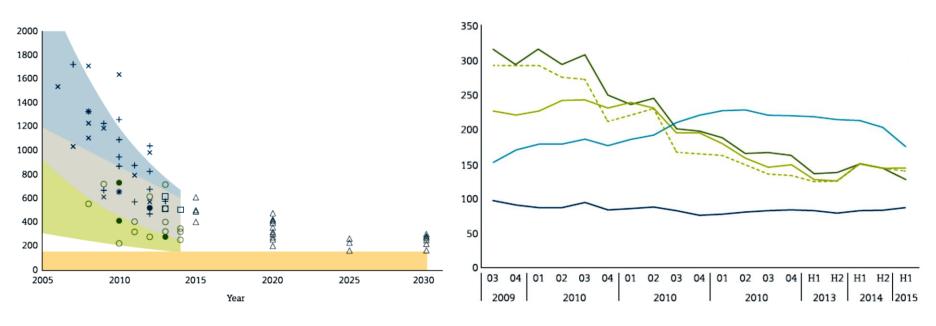

» The Low Carbon Routemap uses scenario modelling to illustrate the policies, targets and actions required for the built environment to meet the UK government's targets to deliver an 80% reduction in greenhouse gas emissions by 2050.

Monitoring, communications and control ³ Smart Grids

specific locations.

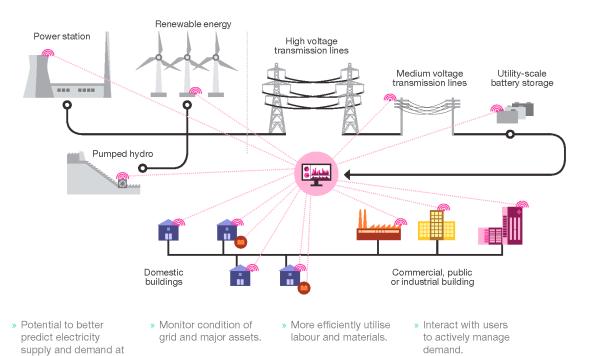

Smart grids enable responsive energy distribution that is better able to cope with growing demand and new supply technologies.

A smart grid is an electricity network incorporating electricity and communications systems that can intelligently respond to nodes connected to it. Smart grids can also include storage and decentralised generation but their salient feature is the integration of high-speed bi-directional communications between systems and the grid.

Why are smart grids important for cities?

Cities are driving increases in electricity demand against the existing, aged and congested grid infrastructure.

It is critical that communication-enabled controls are integrated into urban networks to improve their operation and realise a more sustainable interaction with the power end users.

New governance models for new energy solutions

- Who will own?
- Who will fund?
- Who will regulate?
- Who will operate?
- How will risks be allocated?

Image from Vivid Economics and Arup, "Opportunities to enhance electricity network efficiency," report for UK Department for International Development, 2015

Recap: Energy planning in cities

Integration

• National

• City

• Project

- Drivers
- Secure and resilient
- Clean and low carbon
- Affordable
- Grow local capacity and economy
- Manage urbanisation
- Extend access

Enablers

- Leadership
- Knowledge and evidence
- Technology
- Governance and roles
