# A Low Carbon, Low Water Campus Heat Recovery Chiller Strategy for Moderate Climates

Henry Johnstone P.E.  
GLHN Architects & Engineers, Inc.

# Problem

A university utility operation, facing a combination of inadequate funding, aging infrastructure, worsening reliability, diminishing quality of service, increasing maintenance and utility expense is advised that it must drastically reduce its contribution to green house gas emissions through decarbonization, and its water consumption through conservation.

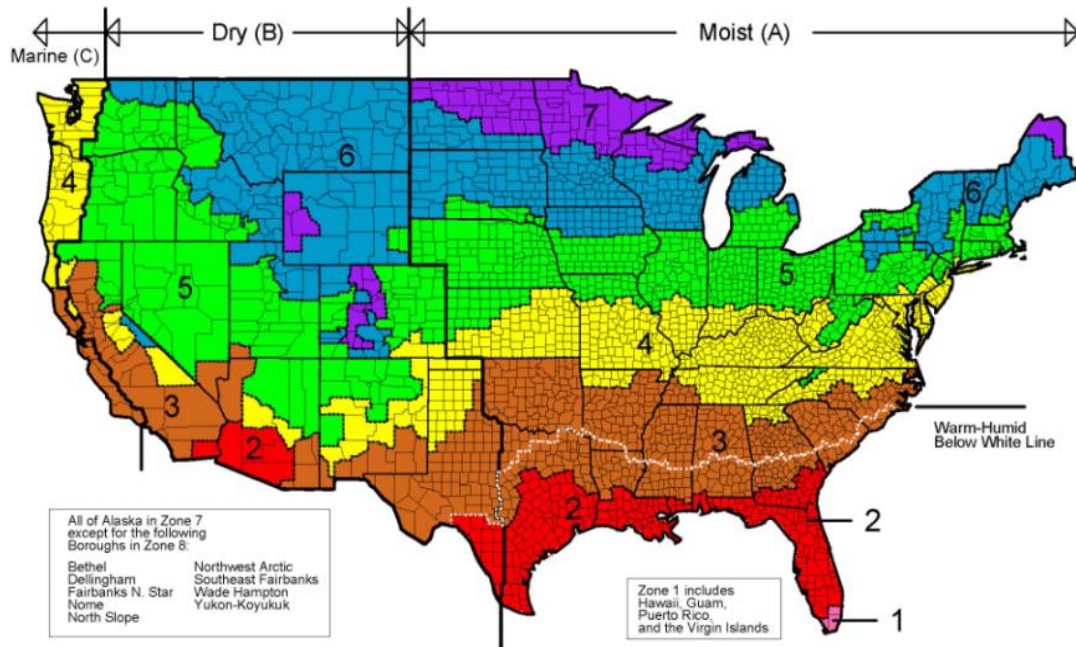

**A plan** that makes a substantive impact on site and source fuel combustion, while addressing renewal and deferred maintenance issues and tying the institutional carbon neutrality goal to a recurrent funding stream could solve the problem over time.

In some locales, phased implementation of **Heat Recovery District Chilling** could be an early stage of the long-term plan.

# A Case Study

## A 1.6 MSF University Campus in Climate Zone 4a

WORKSHOPS | Thermal Distribution: March 2 | Microgrid: March 16

# Thermal Loads

# Production, Distribution, Terminal Use

Steam: Tunnels preferred  
Pipe more durable than tunnels or insulation  
Thermal and mass losses all the way down  
High cost welded steel and code requirements  
Maintenance and Safety

WORKSHOPS | Thermal Distribution: March 2 | Microgrid: March 16

# Production, Distribution, Terminal Use

Heating Hot Water: Various direct buried options  
Lower driving potential for thermal loss  
Simpler operation  
Enables recovery and reuse of low temperature sources

# Production, Distribution, Terminal Use

Four Pipe: Various direct buried options  
Supply to Return dT -a pervasive challenge

# Building Solutions

## Near term

- Discharge Air Temp Reset
- Retro Commissioning
- Exhaust air heat recovery
- Add or replace coils
- Dual service in interim?
- In-building supplemental heat!

## Long term

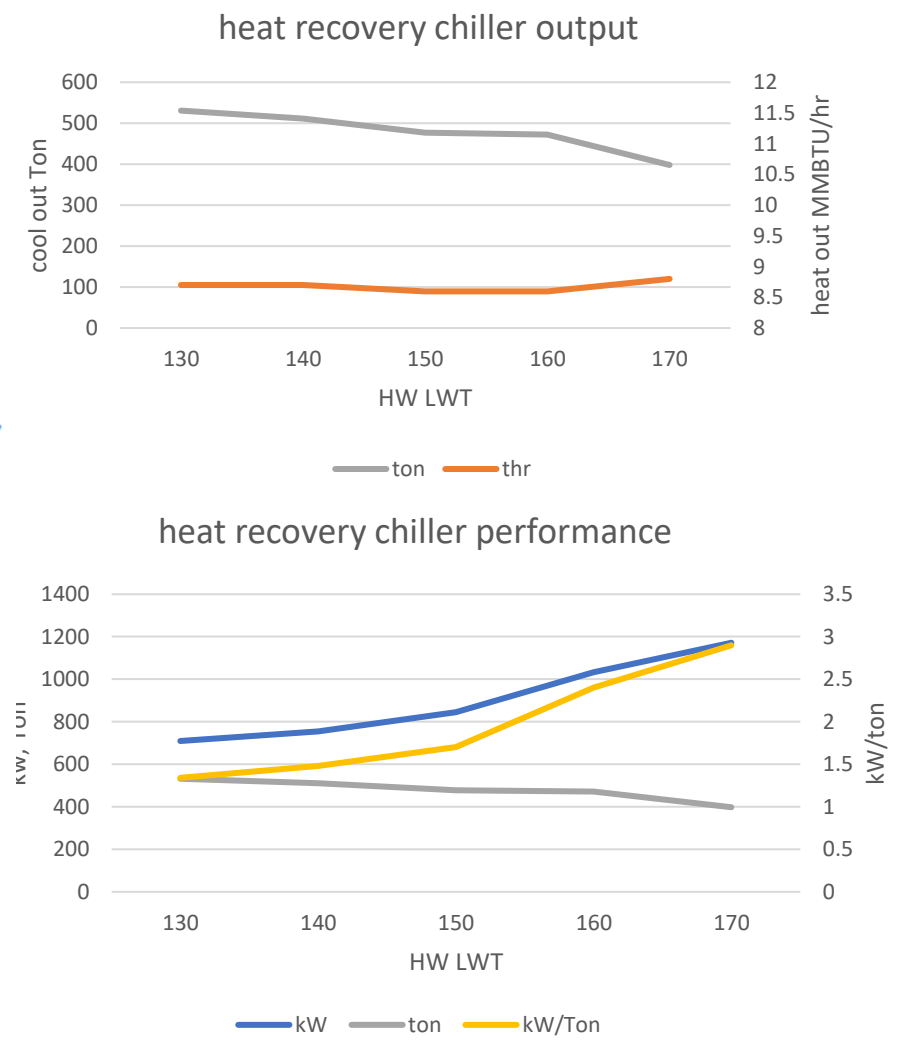

- Rewrite design standards
- AHU replacements
- Deferred Maintenance
- Consider separating lower temperature perimeters from ventilation
- Address simultaneous Heat/Cool

# Heat Recovery Chiller Constraints

Some limits to operational boundaries

# Plant Solutions

## Near term

- Evaluate simultaneous H+C
- Reset HHW temp
- Side car supplement
- Natural Gas at peak
- eBoiler supplemental heat

## Long term

Look for opportunities

- chiller replacement
- Tower replacement
- Boiler replacement
- Tunnel repairs; HHW nodes
- Utility extensions

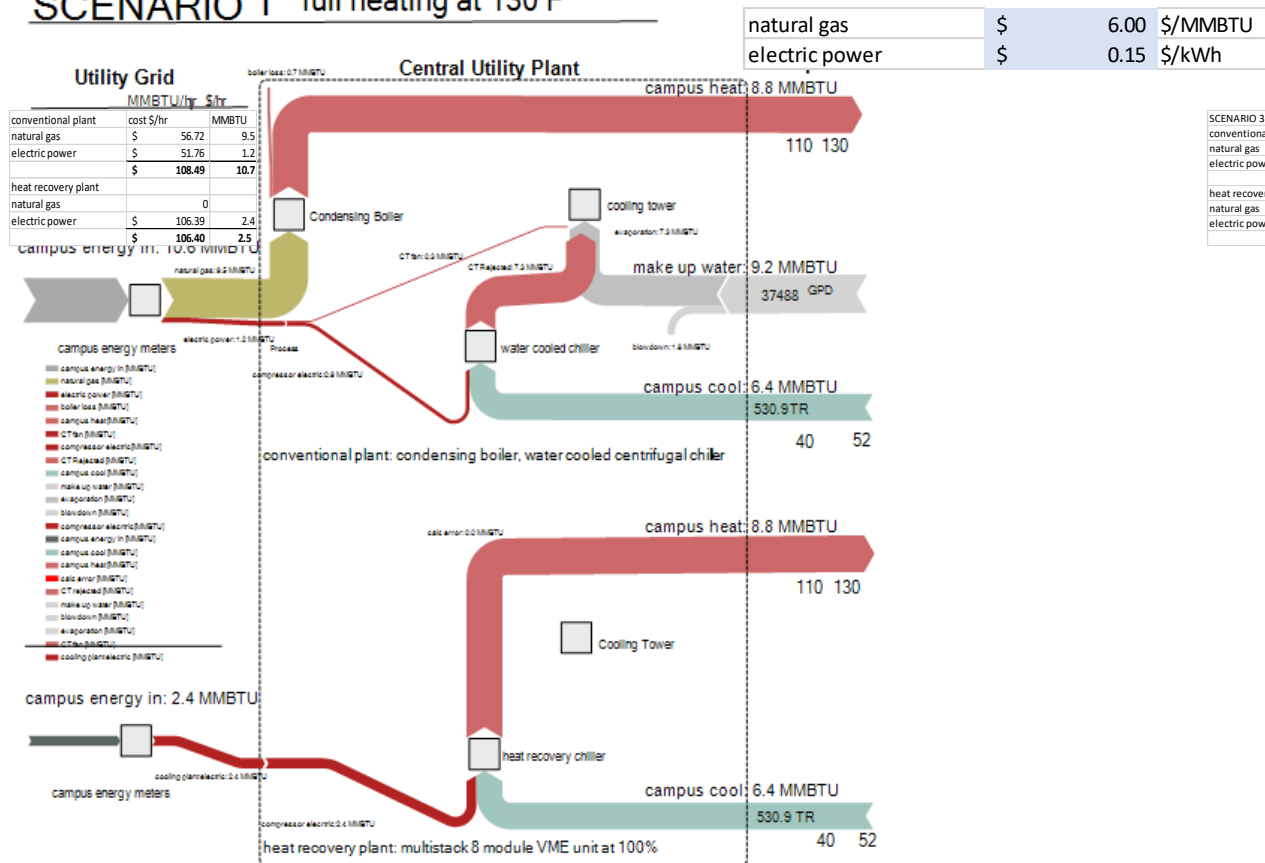

# Phased Distribution Solutions

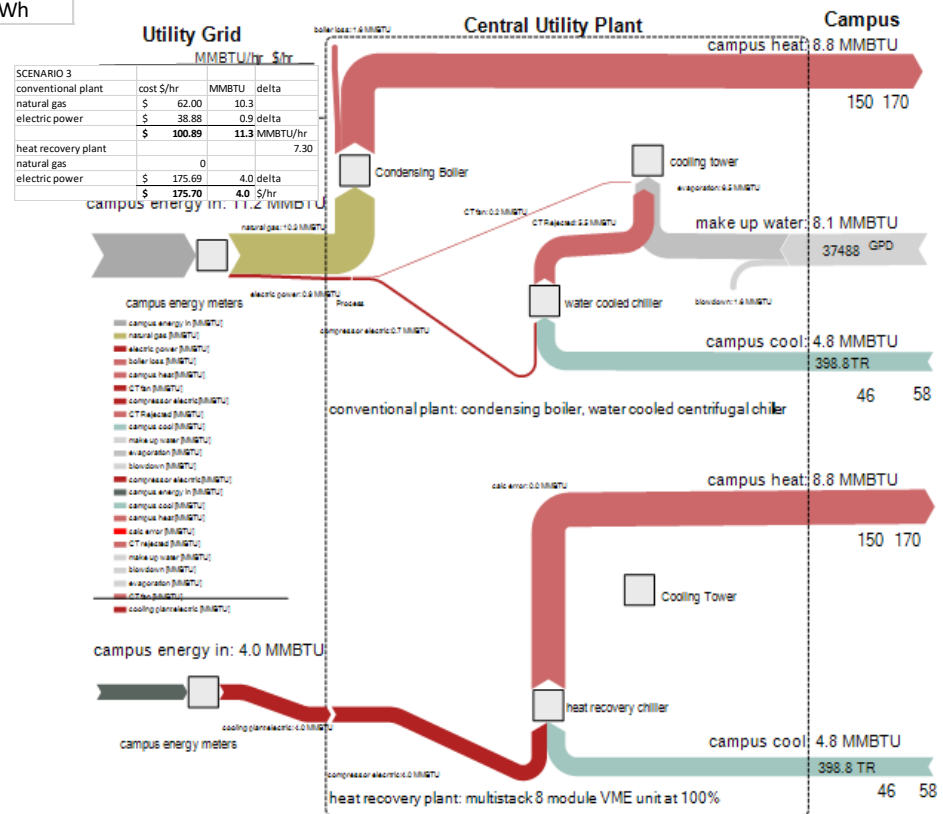

- Start small and near main or satellite plant
- Heat exchanger nodes
- Abandon irreparable tunnel strategies
- Size improvements for lower temp HHW

# Graphical Comparison

SCENARIO 1 full heating at 130 F

### SCENARIO 3 full campus heat at 150/170

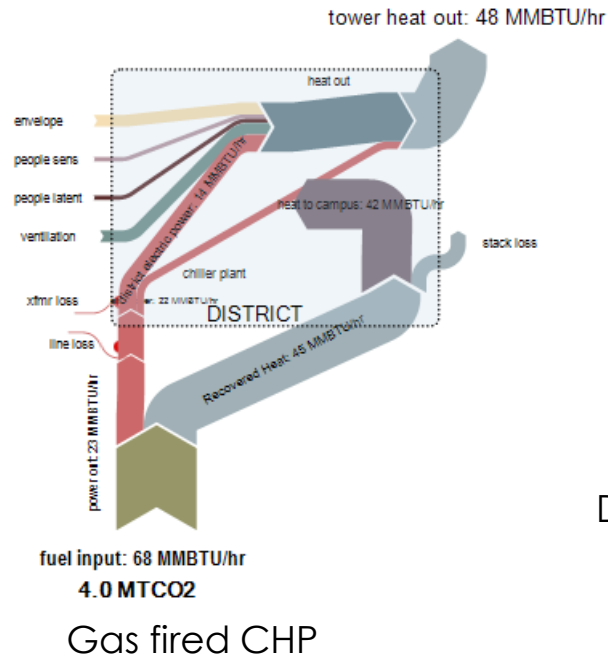

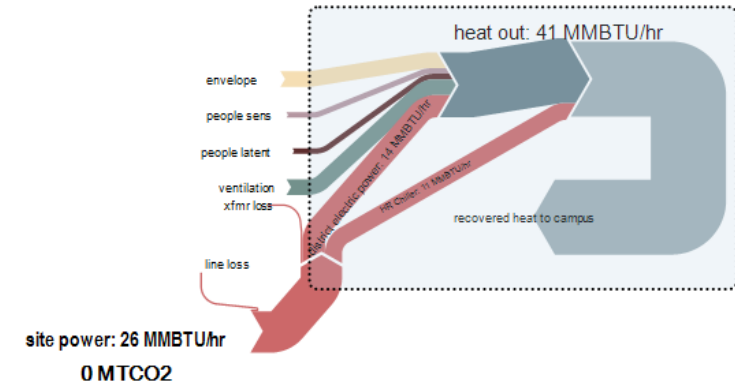

# Graphical Comparison

Coal fired grid power, natural gas boiler

A moment in time- Simultaneous Campus heating cooling demand  
2500 Ton cooling  
42 MMBTU/hr heating

Decarbonized grid: Heat recovery chilling

# A District Energy Opportunity

- Utilizes district simultaneous heating and cooling
  - Reduces base loaded fuel combustion
  - Enables utilization of thermal energy storage
  - Integrates with microgrid demand
  - Incremental phase-in
- 
- *Way* better COP than eBoiler
  - Water savings!
